

Formation of Planetary Systems

Lecture 2 - Protoplanetary discs

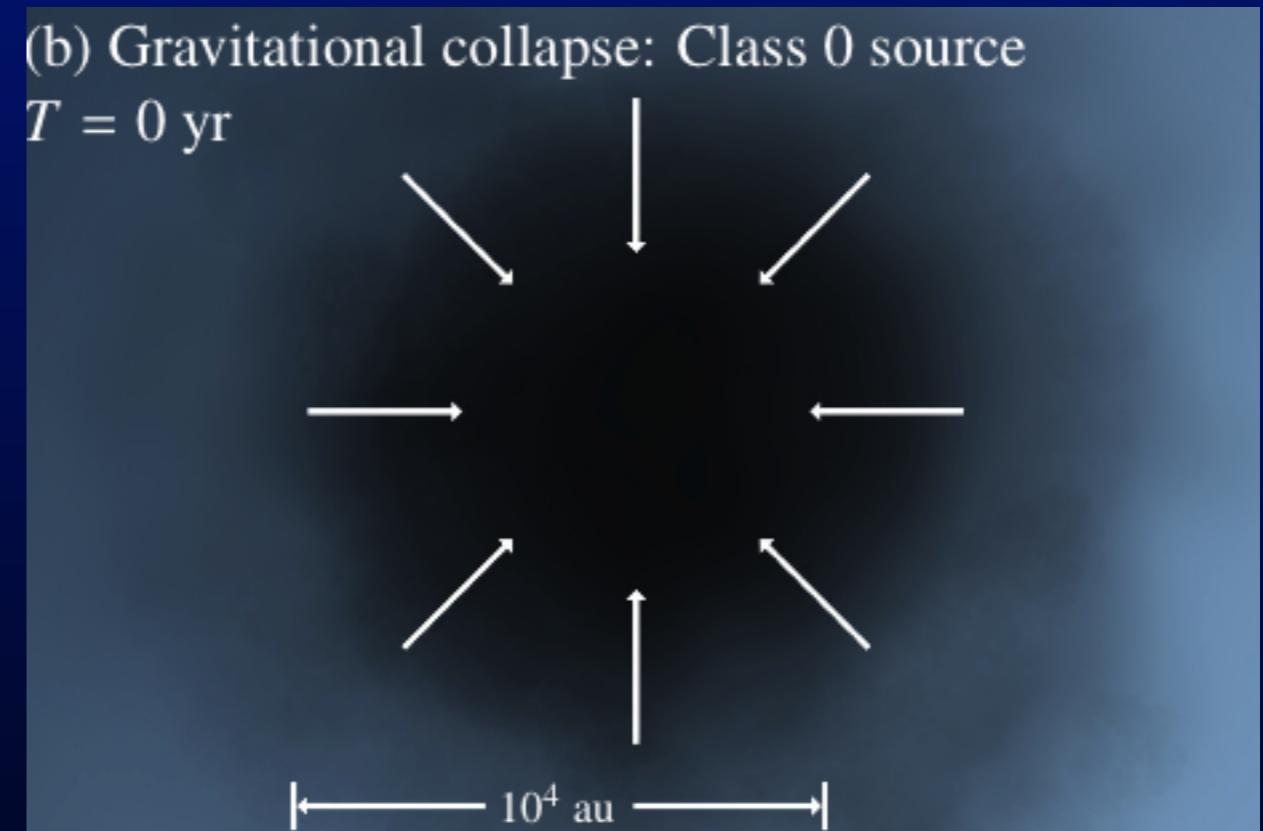

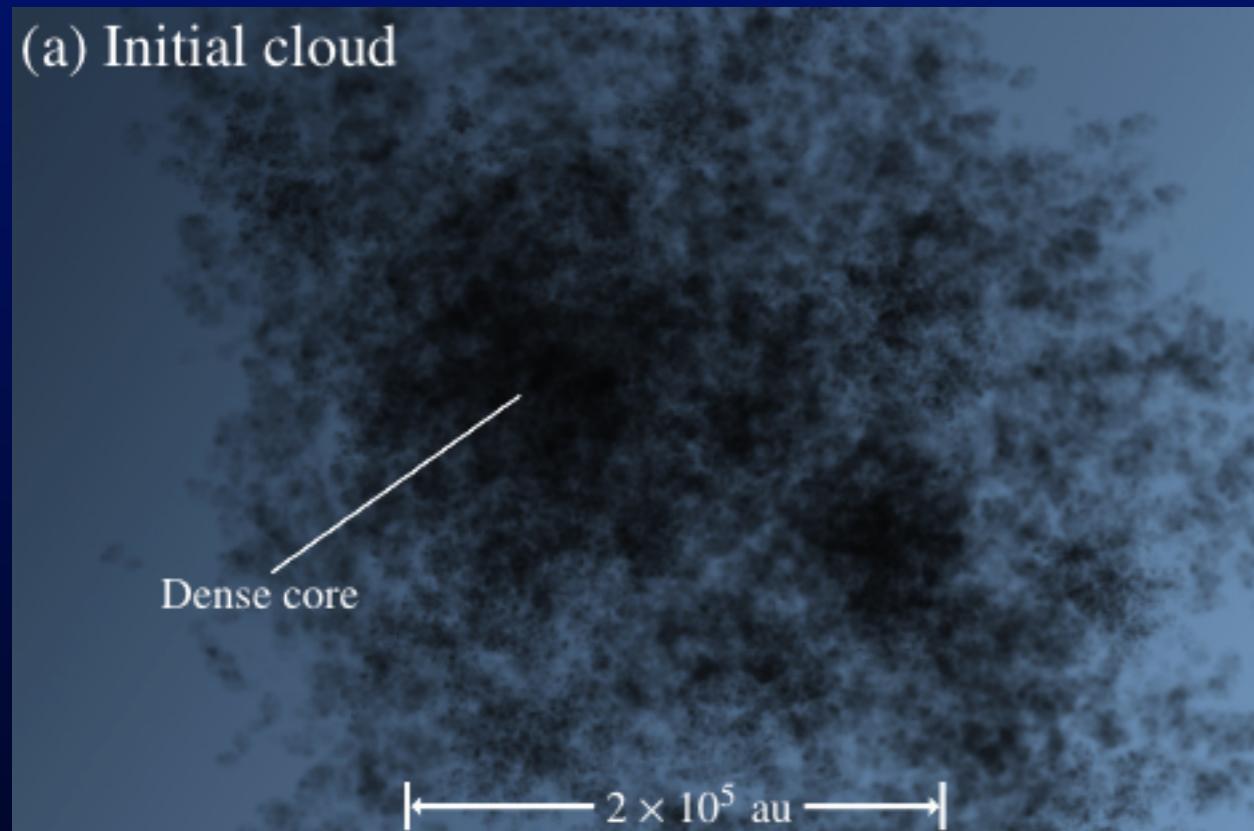

UNIVERSITY OF
LEICESTER

Course Outline

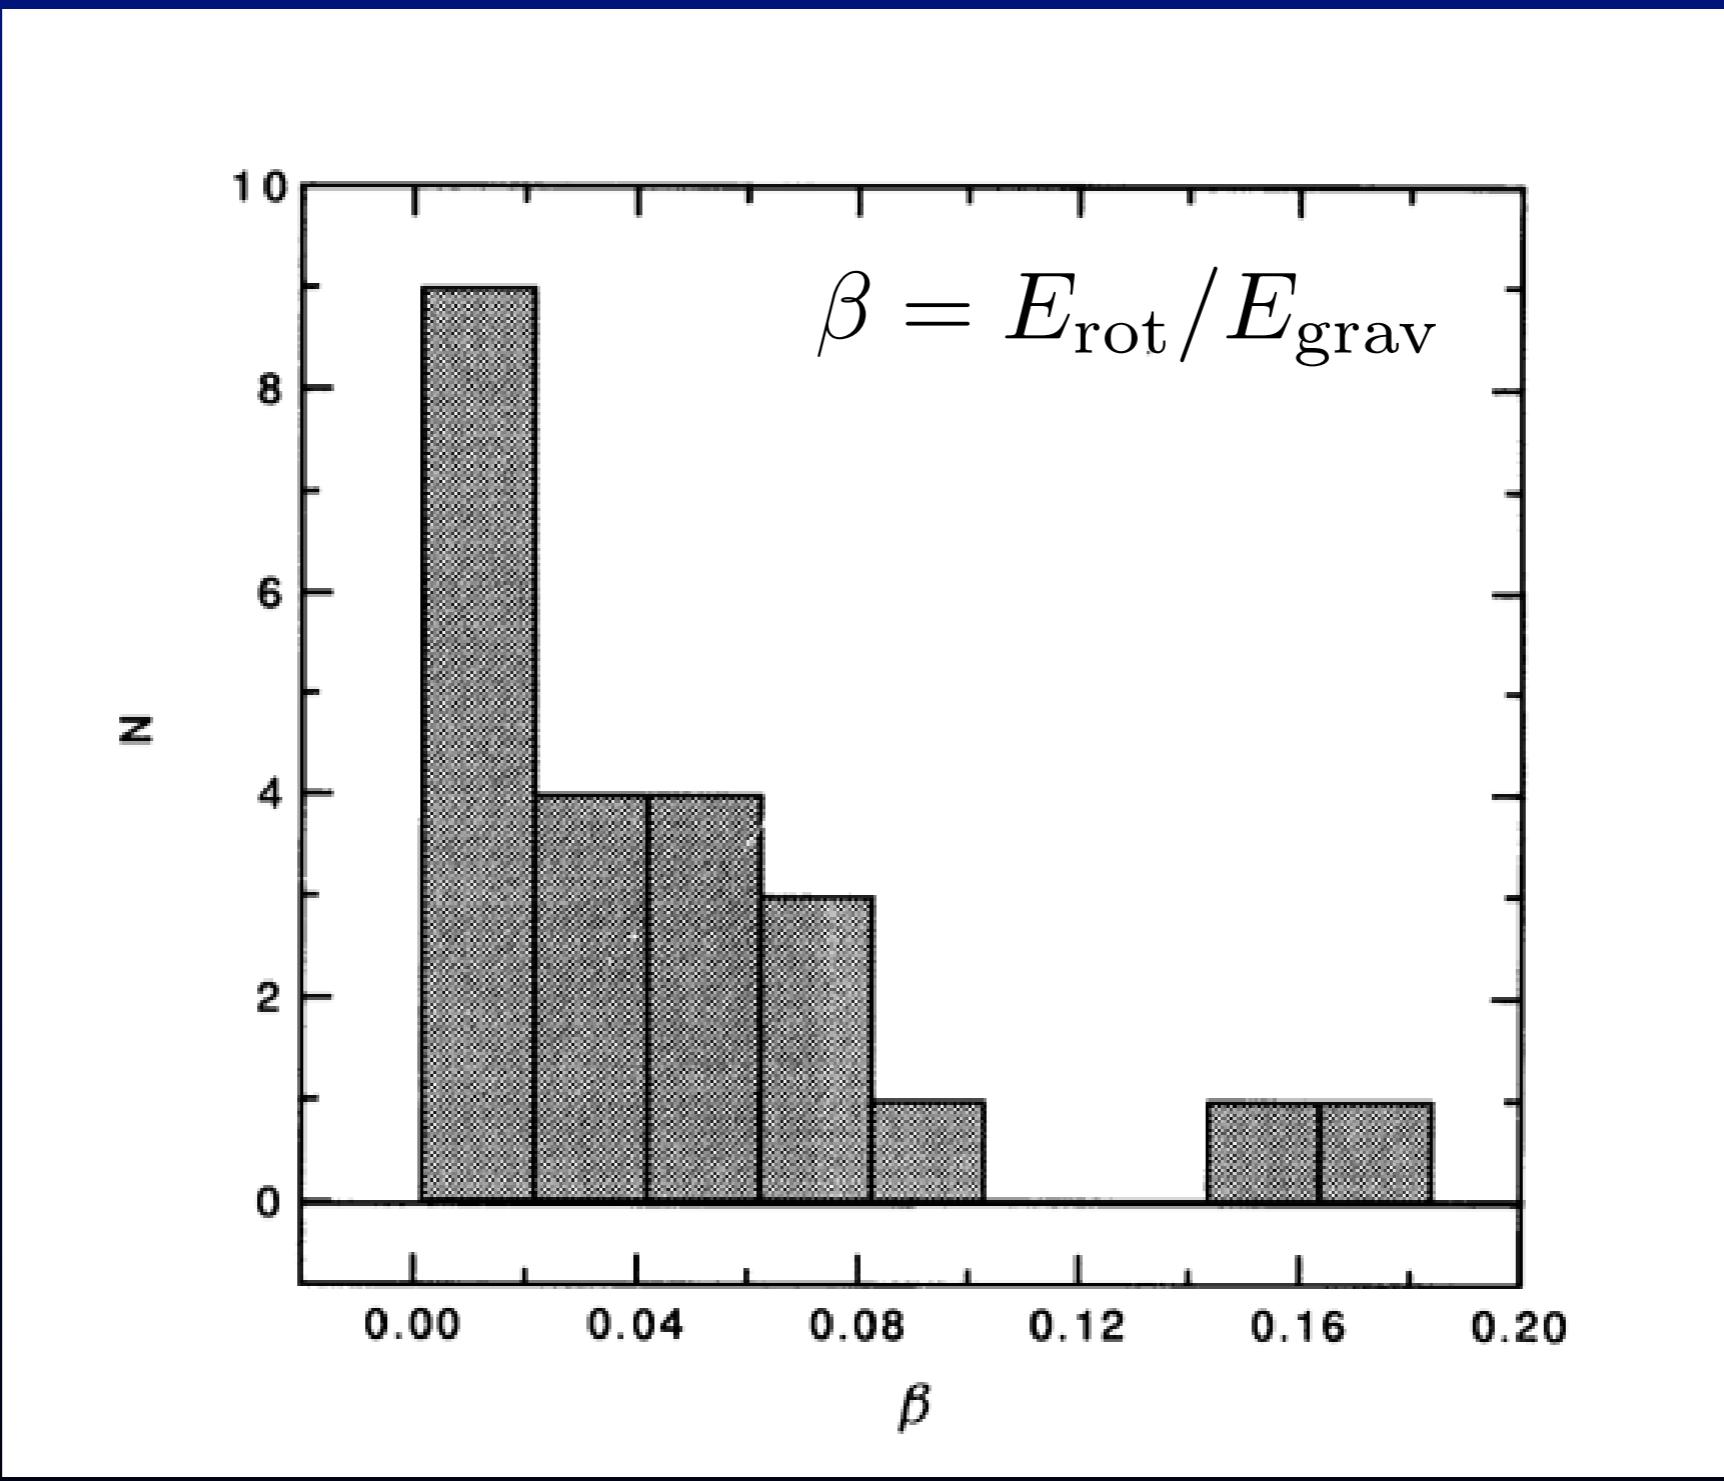

- 5 Lectures, 2 hours each (with a break in the middle!).
 - 1) Observations of planetary systems
 - 2) Protoplanetary discs
 - 3) Dust dynamics & planetesimal formation
 - 4) Planet formation
 - 5) Planetary dynamics
- Notes for each lecture will be placed on the course home page in advance - you may find it useful to annotate these as we go.
- These slides will also be posted online.
- Textbooks: Armitage - *Astrophysics of planet formation* (CUP).
Protostars & Planets series (V - 2007; VI - 2014)

Gravitational collapse

Figures from Alex Dunhill (PhD thesis, 2013), after Shu et al. (1987)

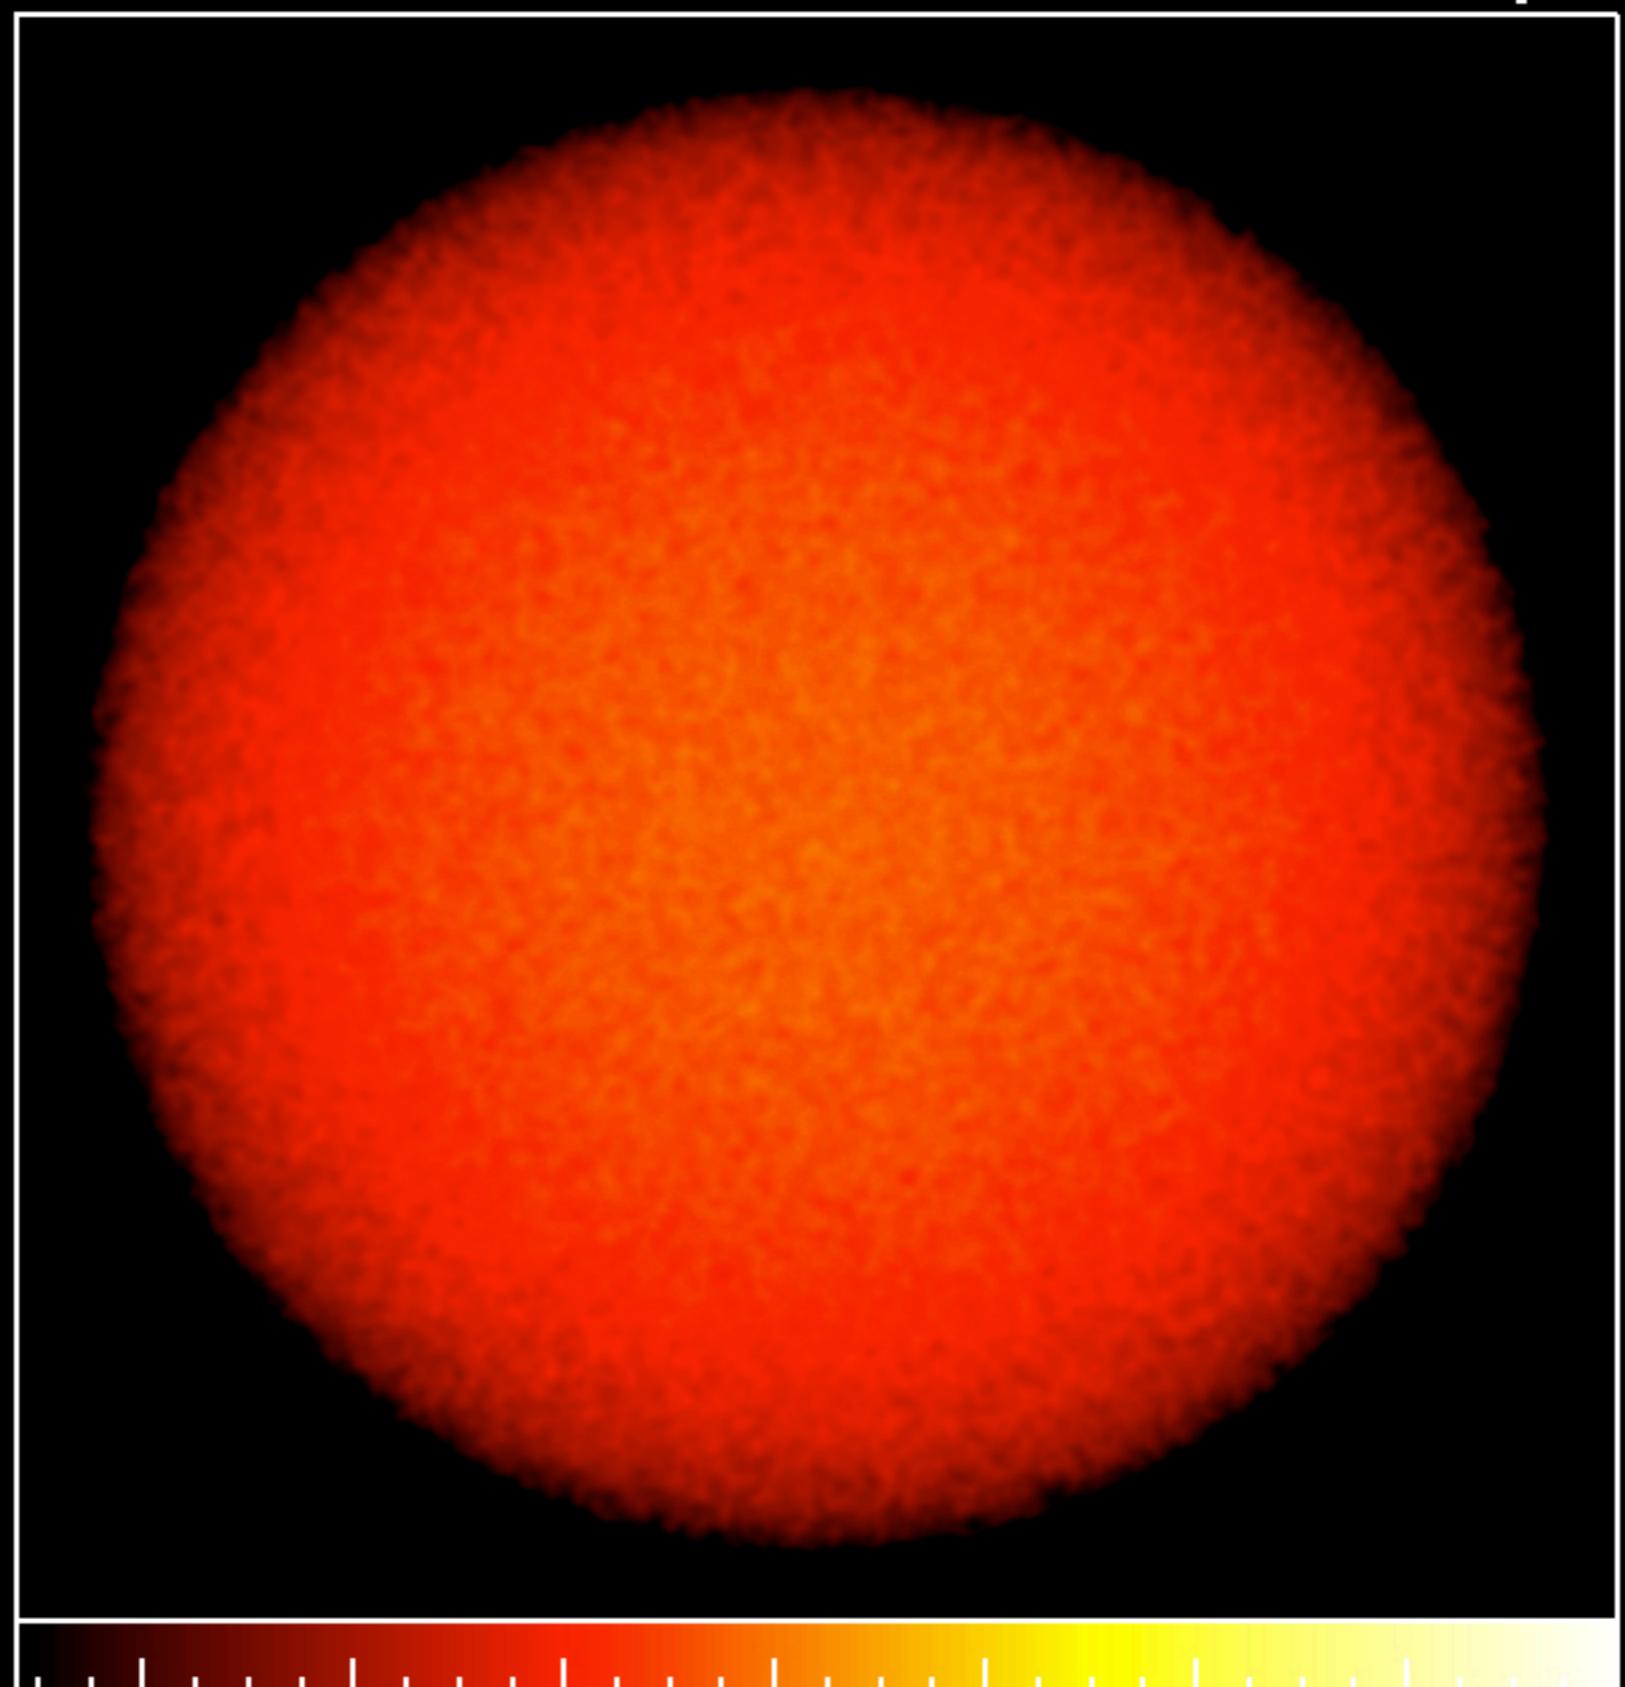

Measuring rotation

Goodman et al. (1993)

Dimensions: 82500. AU

Time: 0. yr

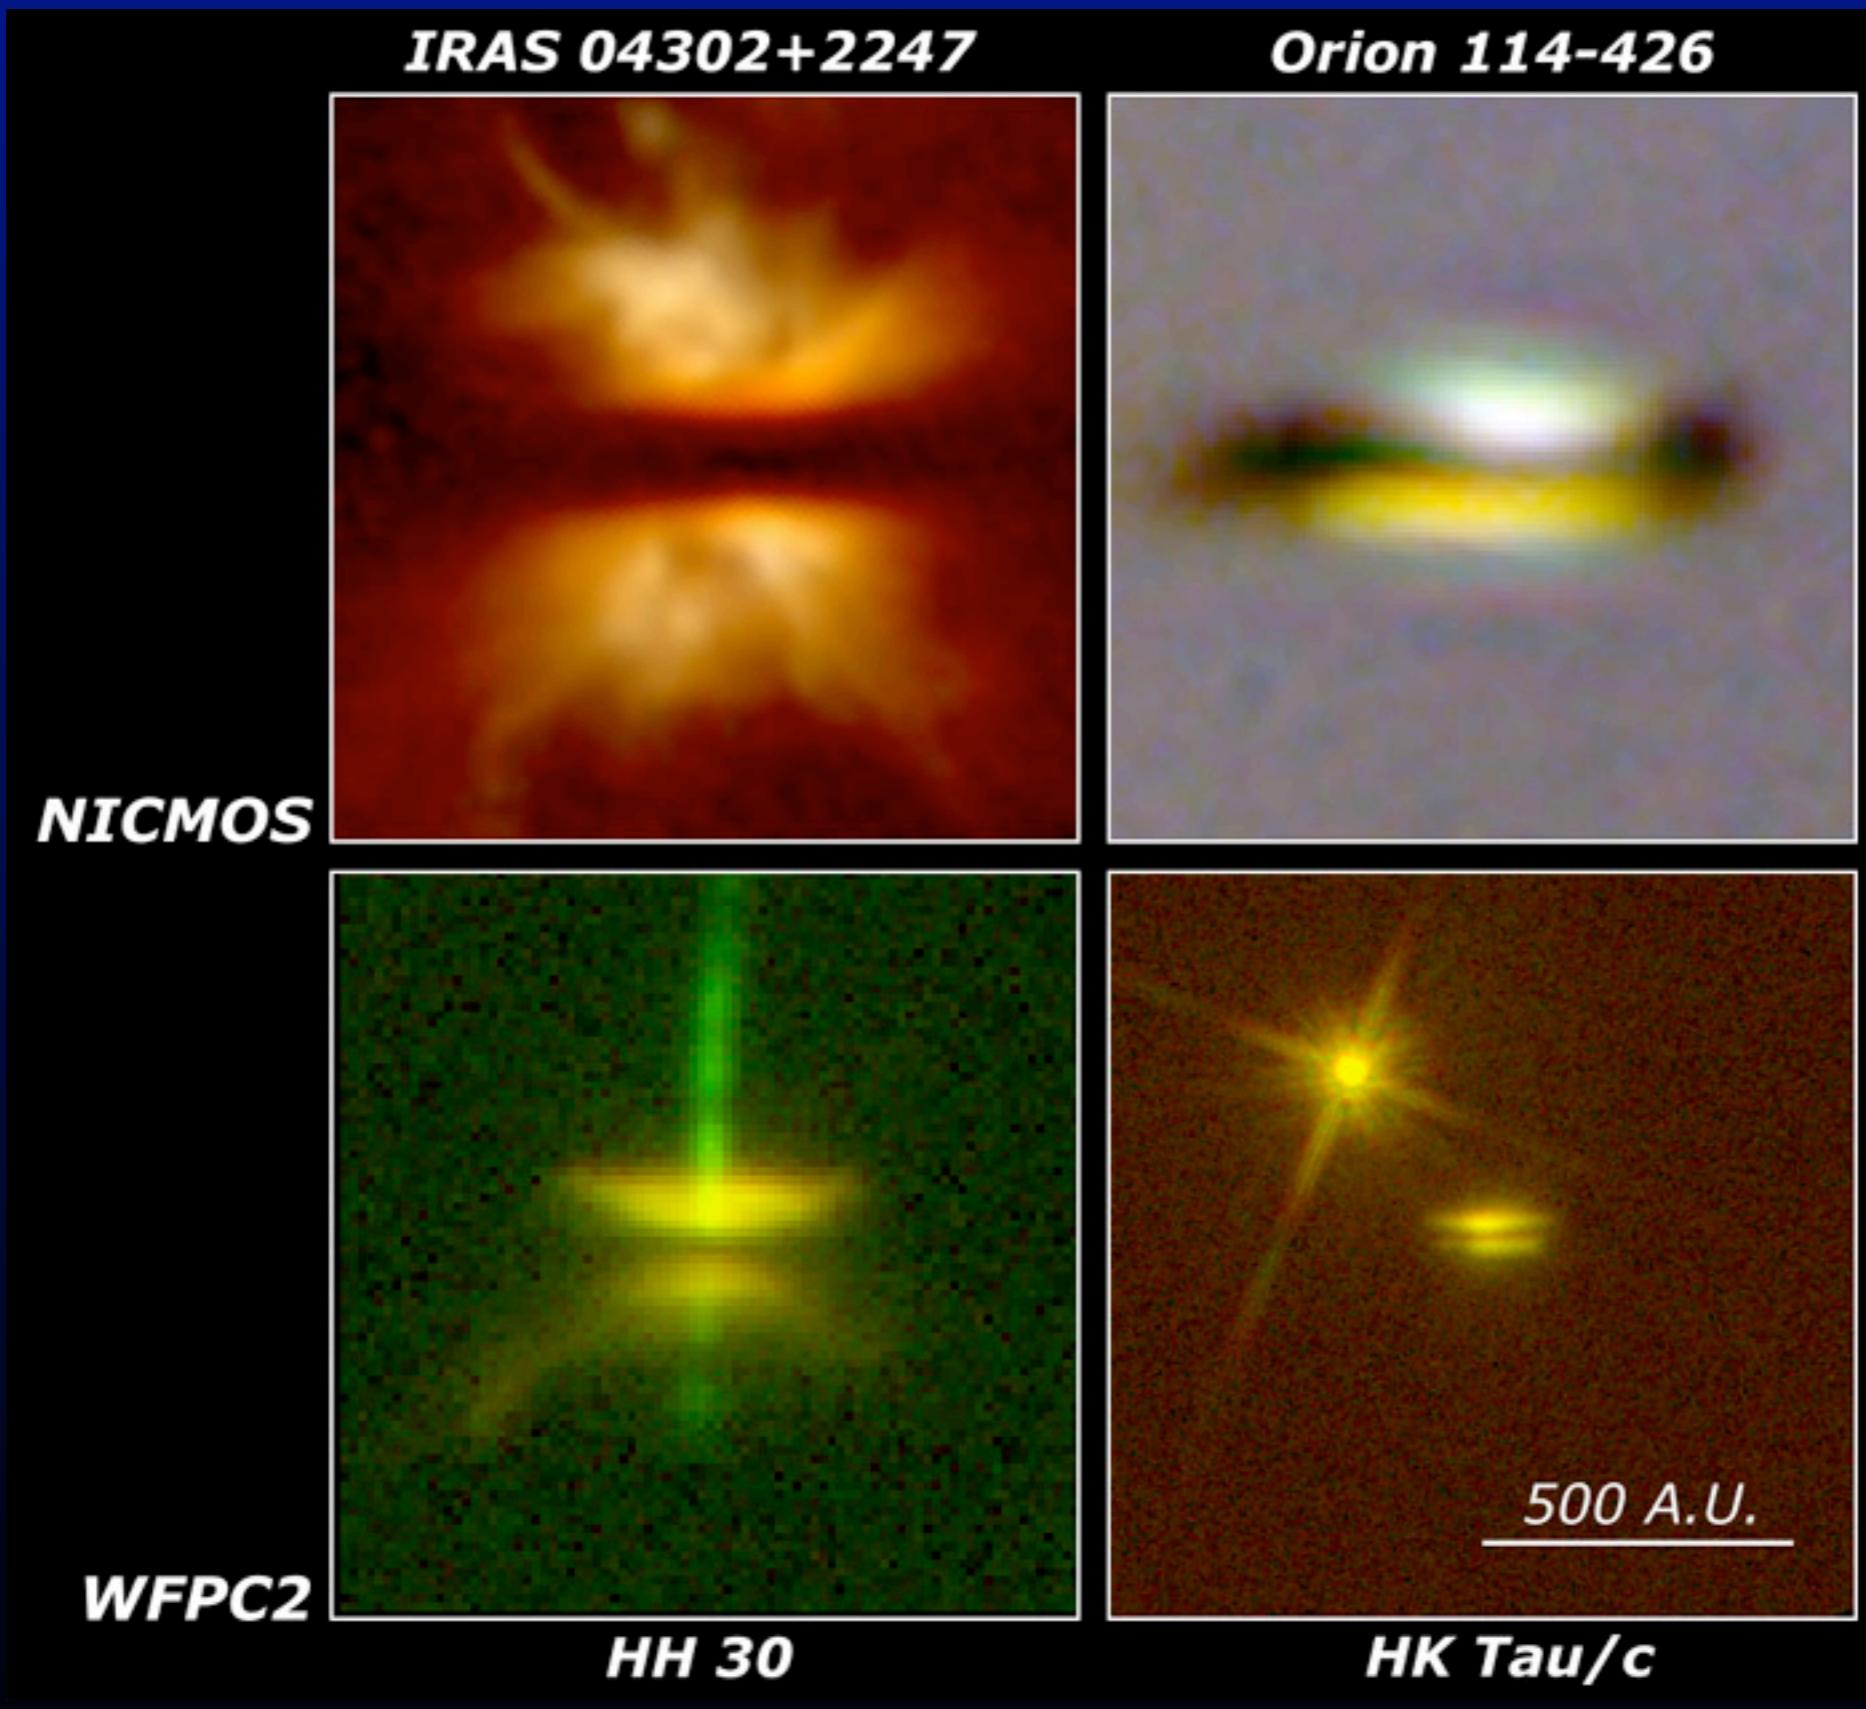

-1.4 -1.2 -1.0 -0.8 -0.6 -0.4 -0.2 0.0

Log Column Density [g/cm^2]

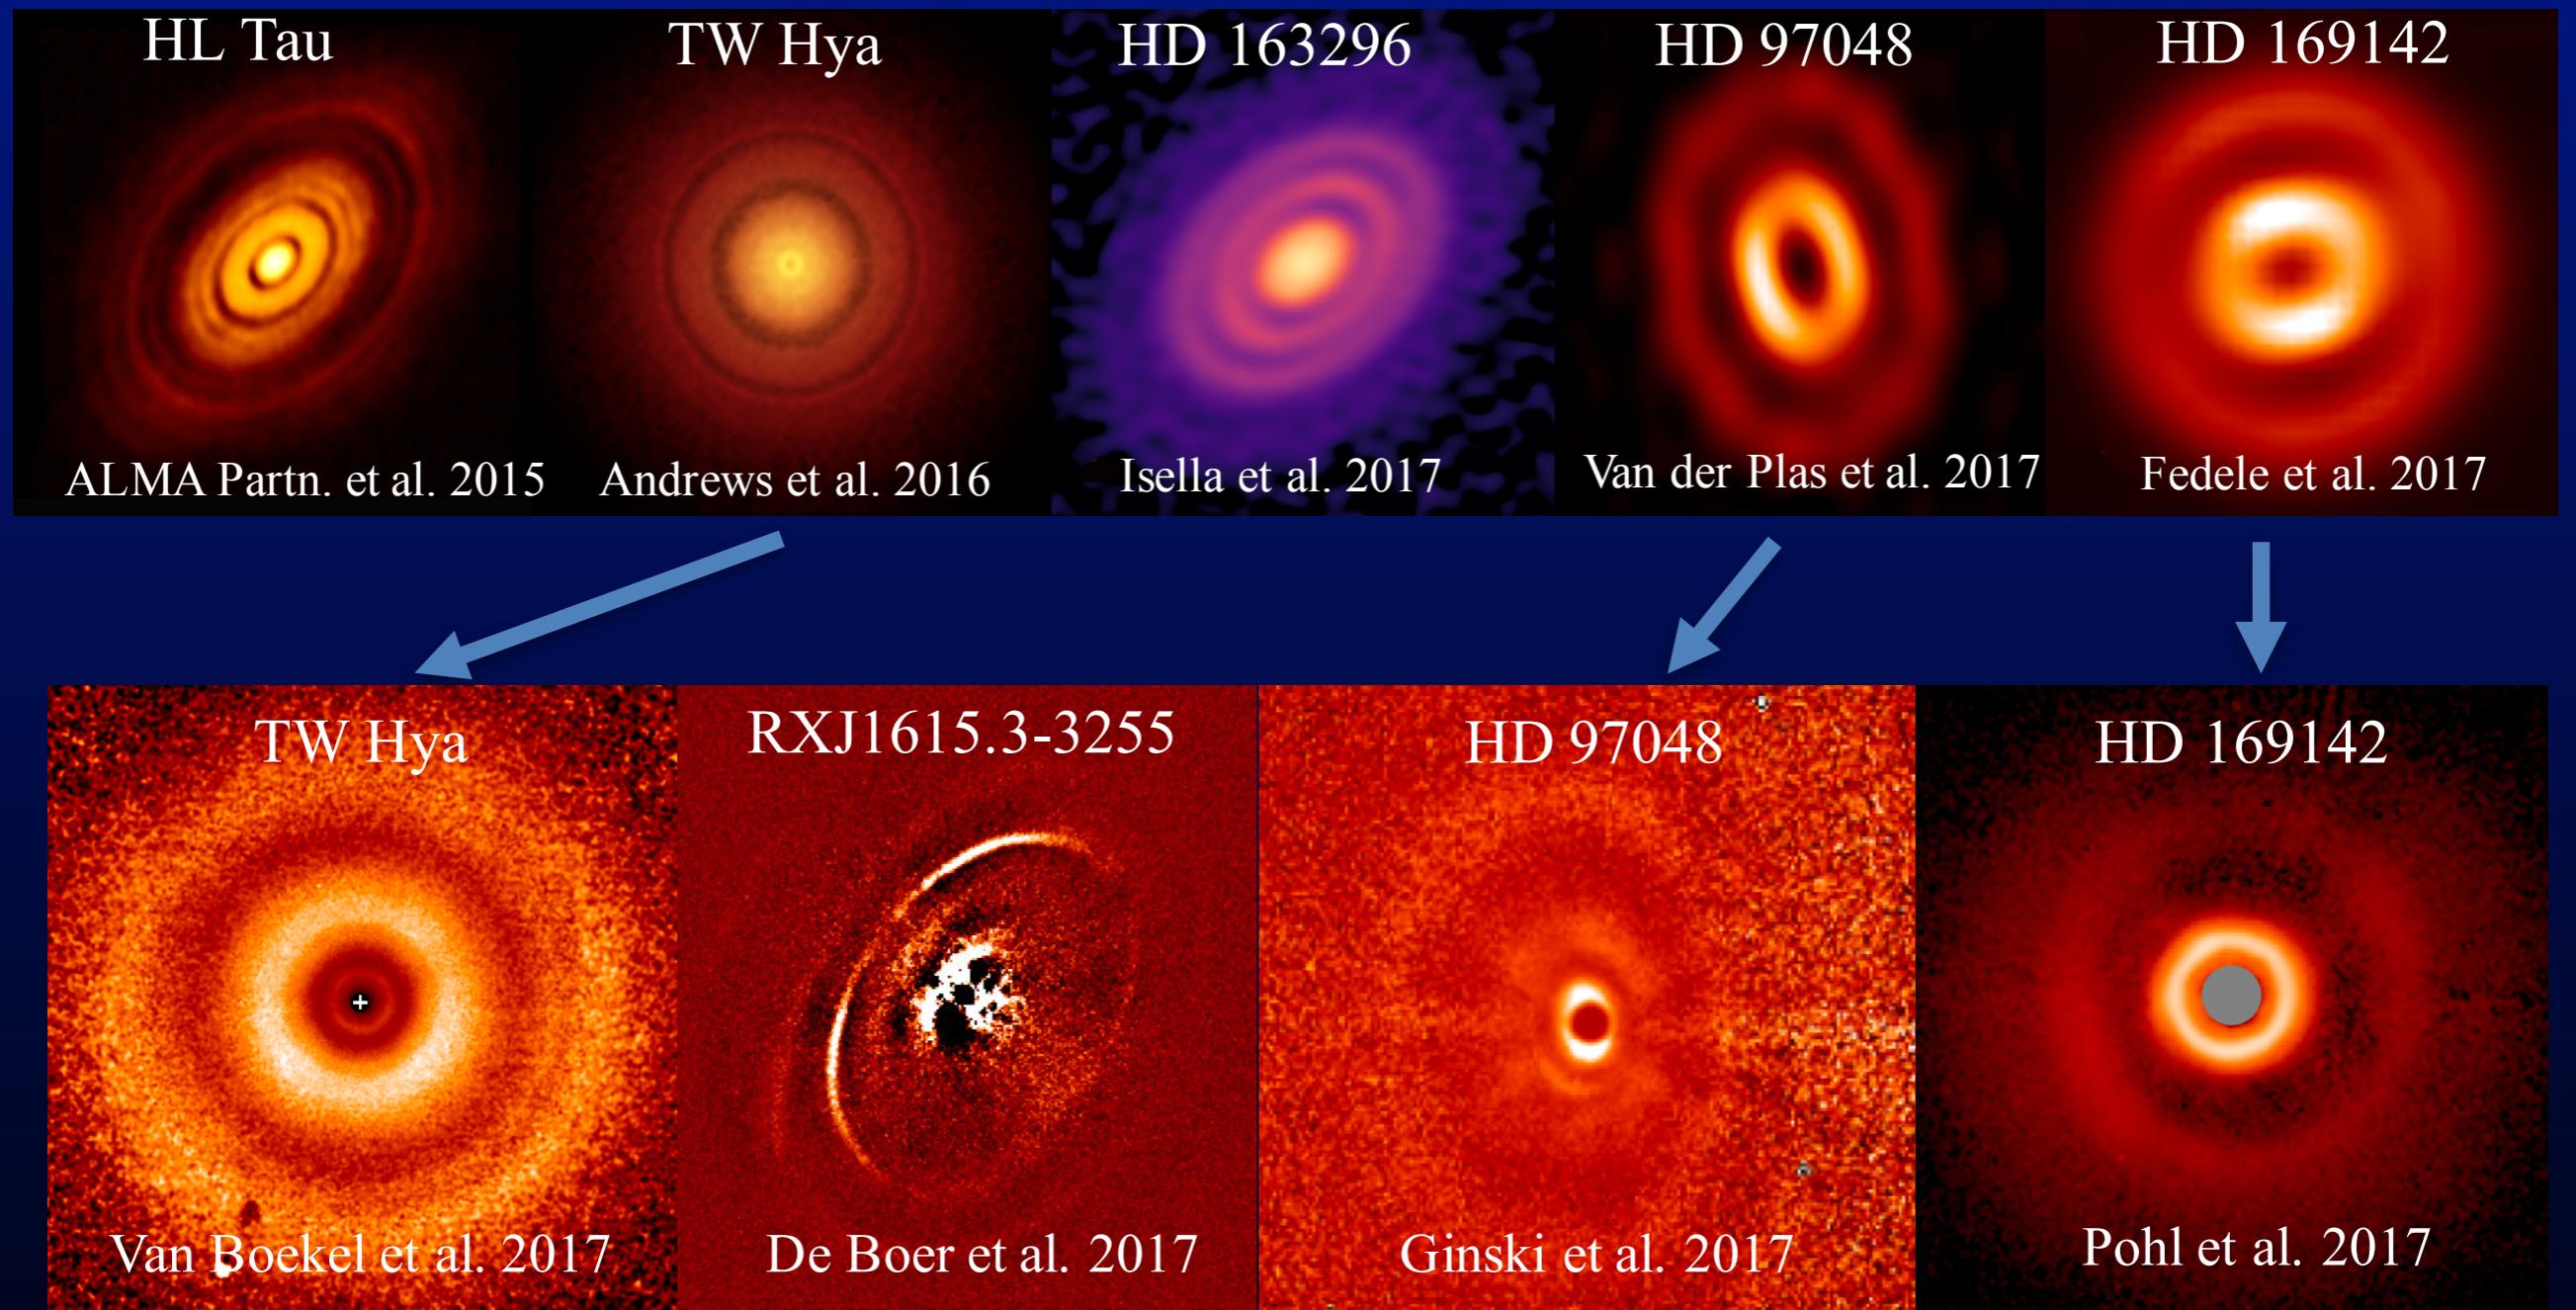

Matthew Bate

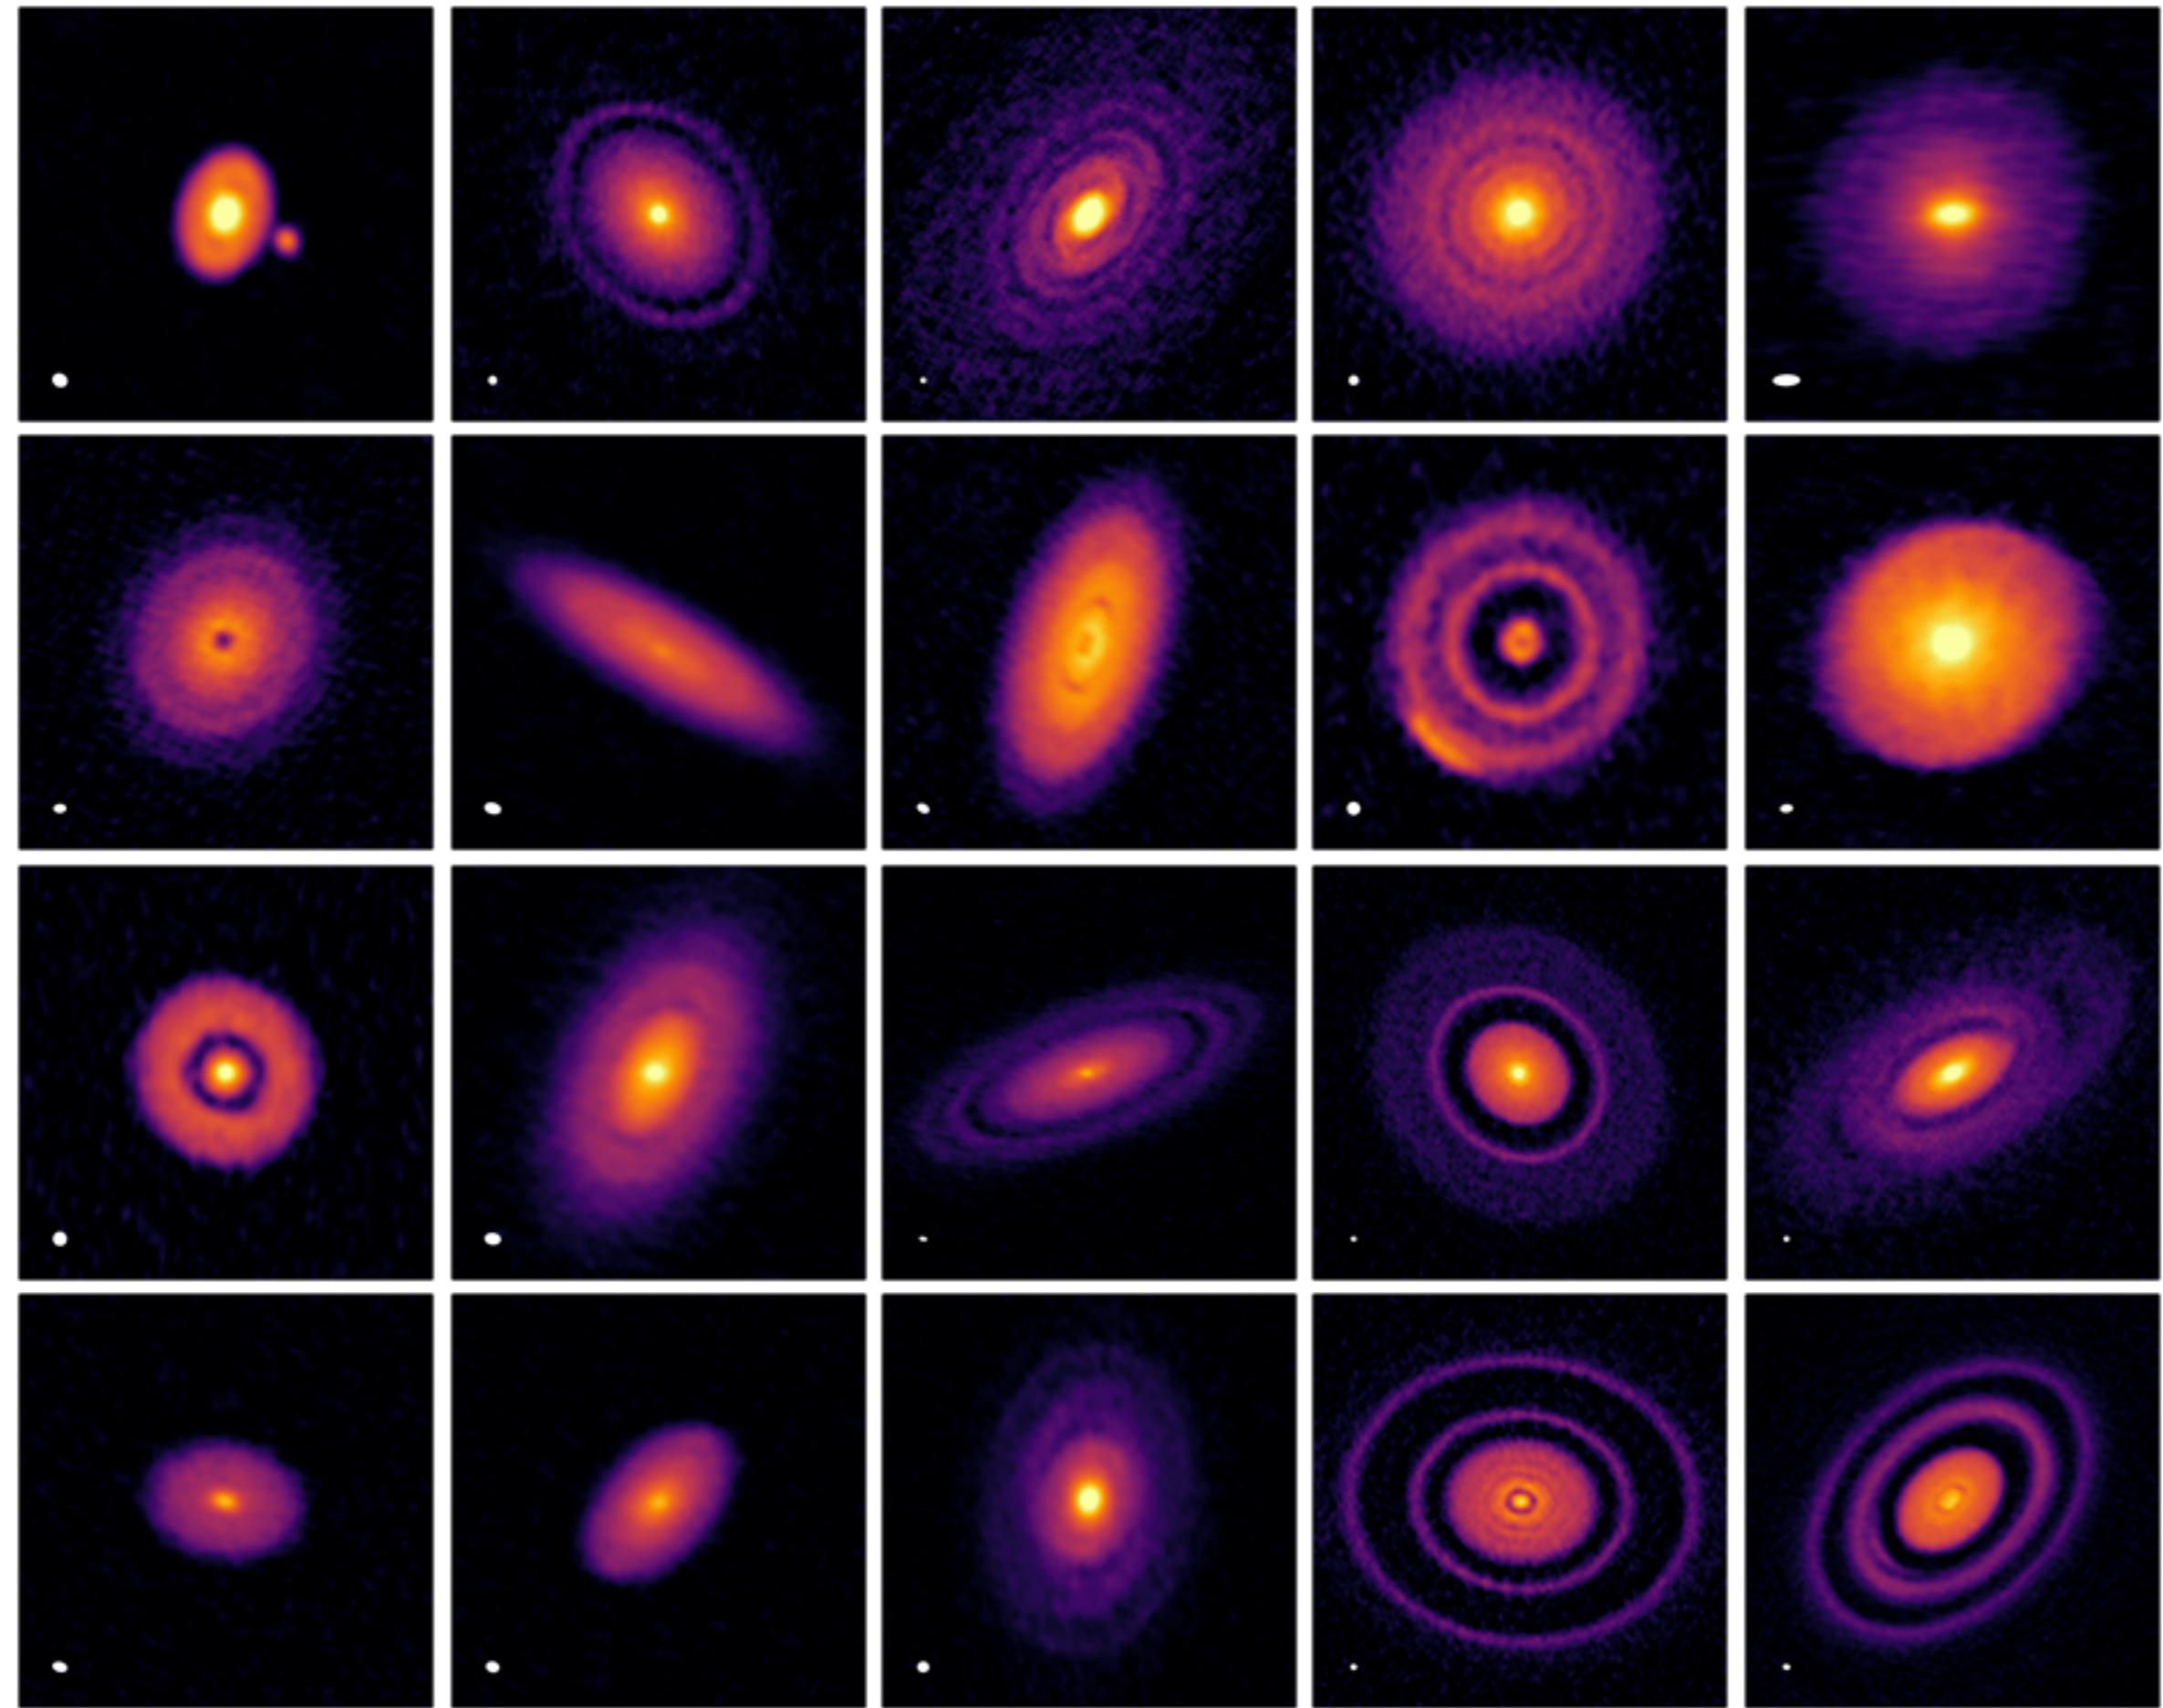

Bate et al. (2002, 2003)

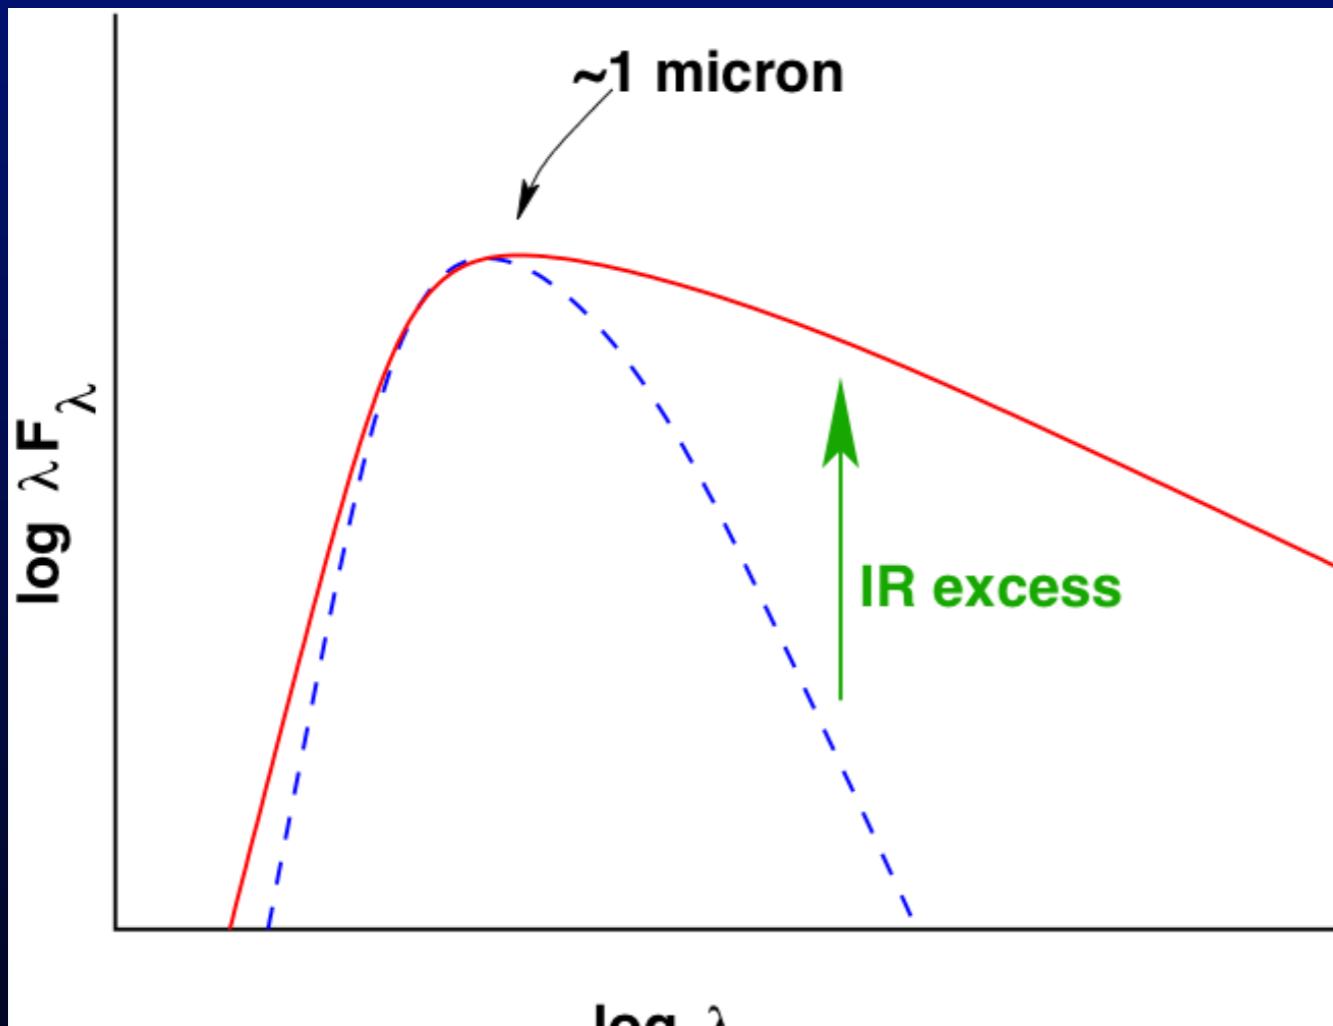

HL Tau @ 1.3mm: ALMA partnership (2015)

ALMA “DSHARP” survey; Andrews et al. (2018)

SED Classification Scheme

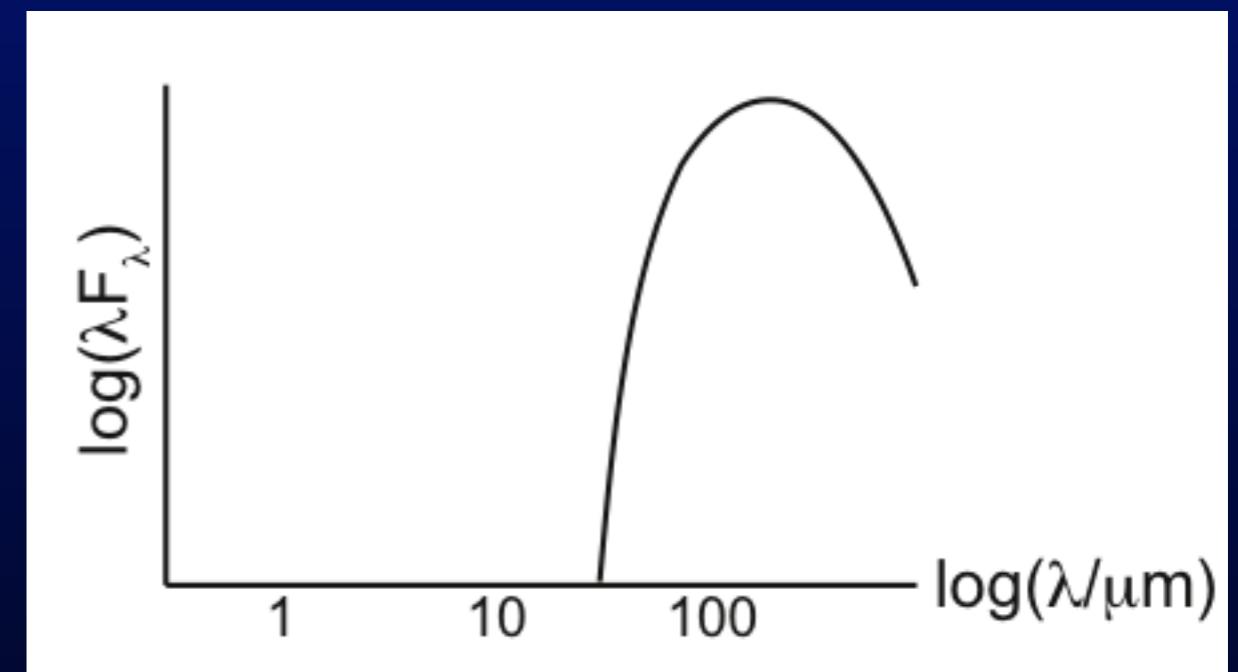

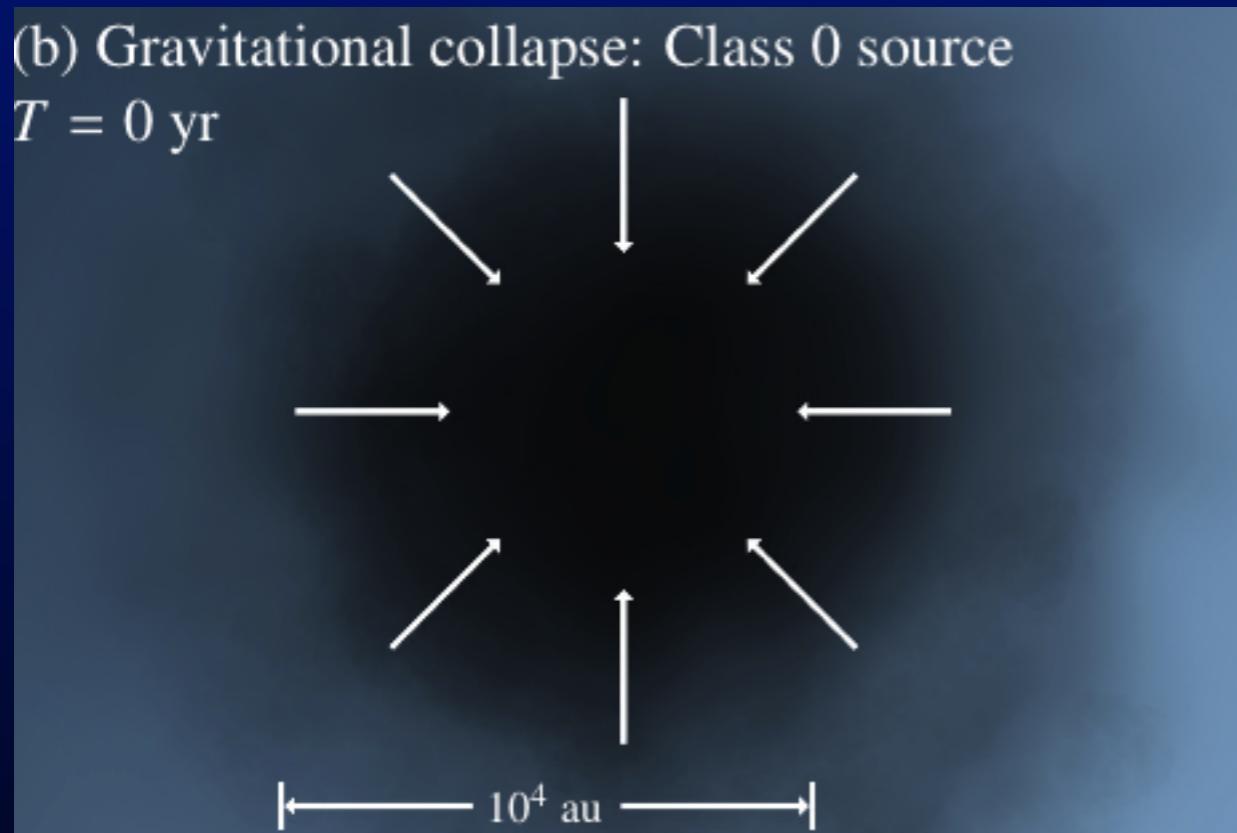

Armitage (2007)

$$\alpha_{\text{IR}} = \frac{d \log (\lambda F_\lambda)}{d \log \lambda}$$

SED Classification Scheme

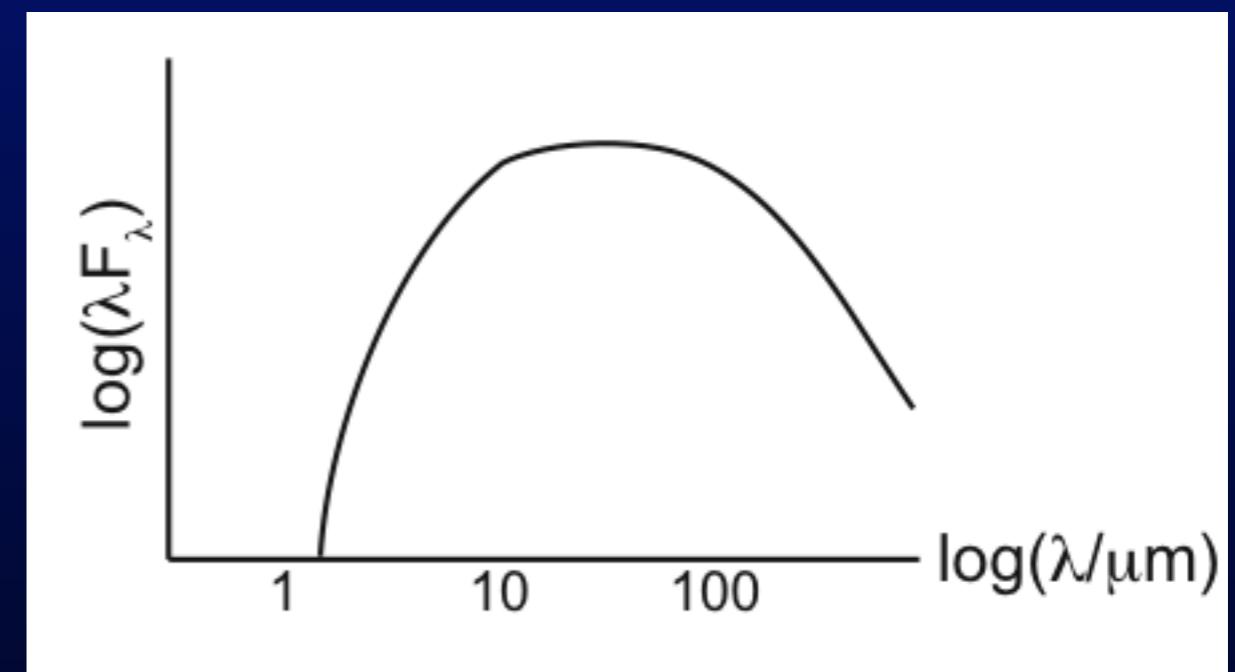

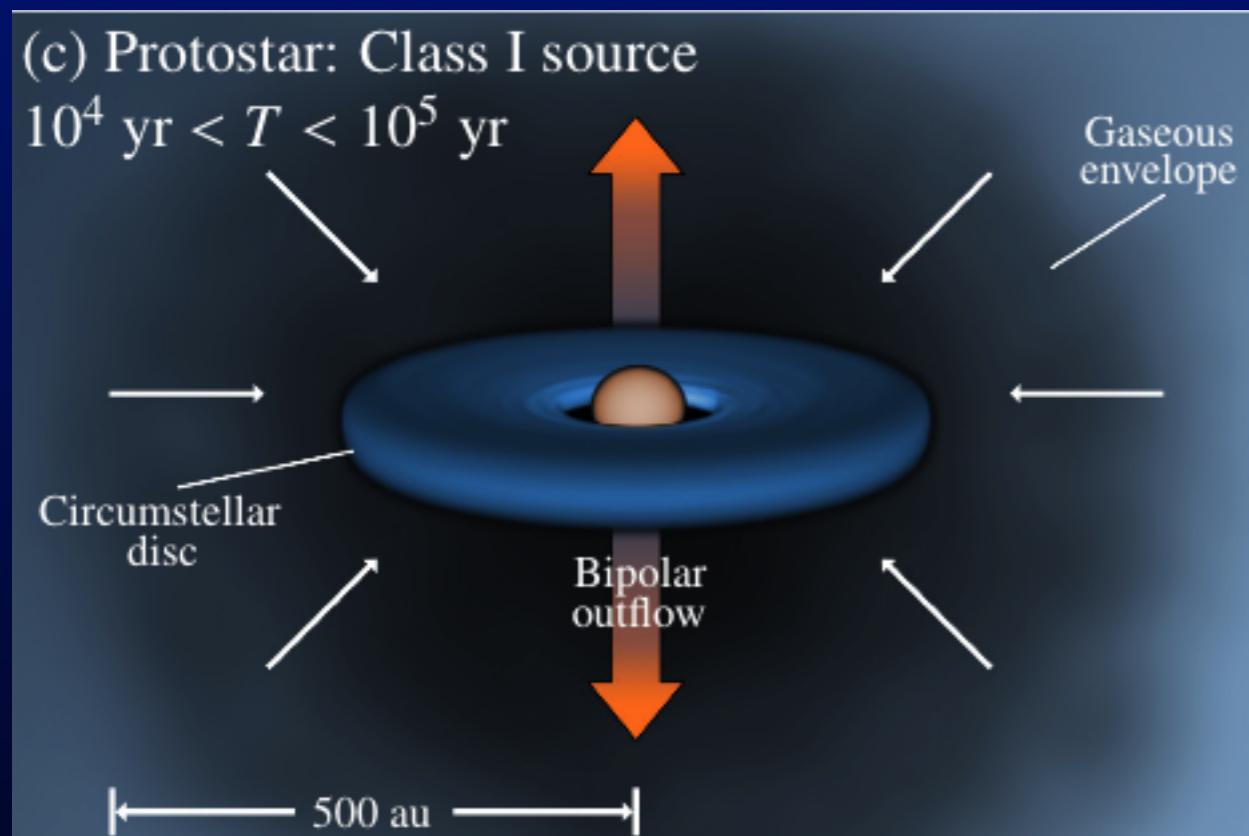

Figures from Alex Dunhill (PhD thesis, 2013) & Armitage (2010)

Class 0: sub-mm sources, no detectable IR emission

SED Classification Scheme

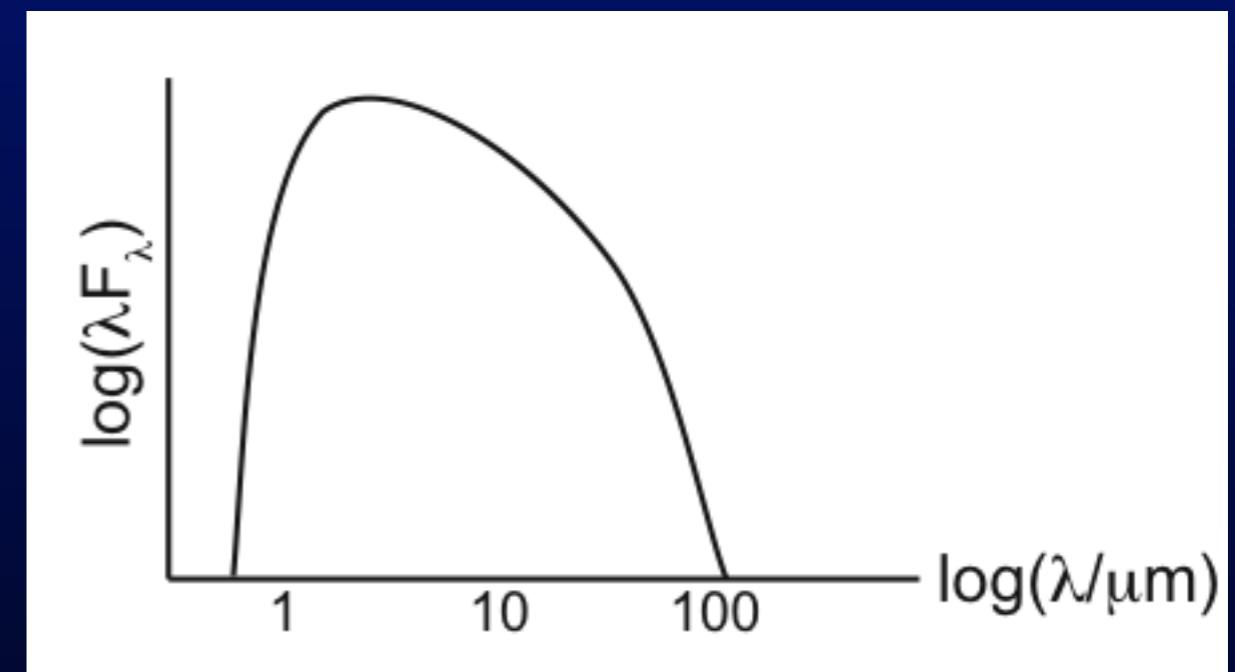

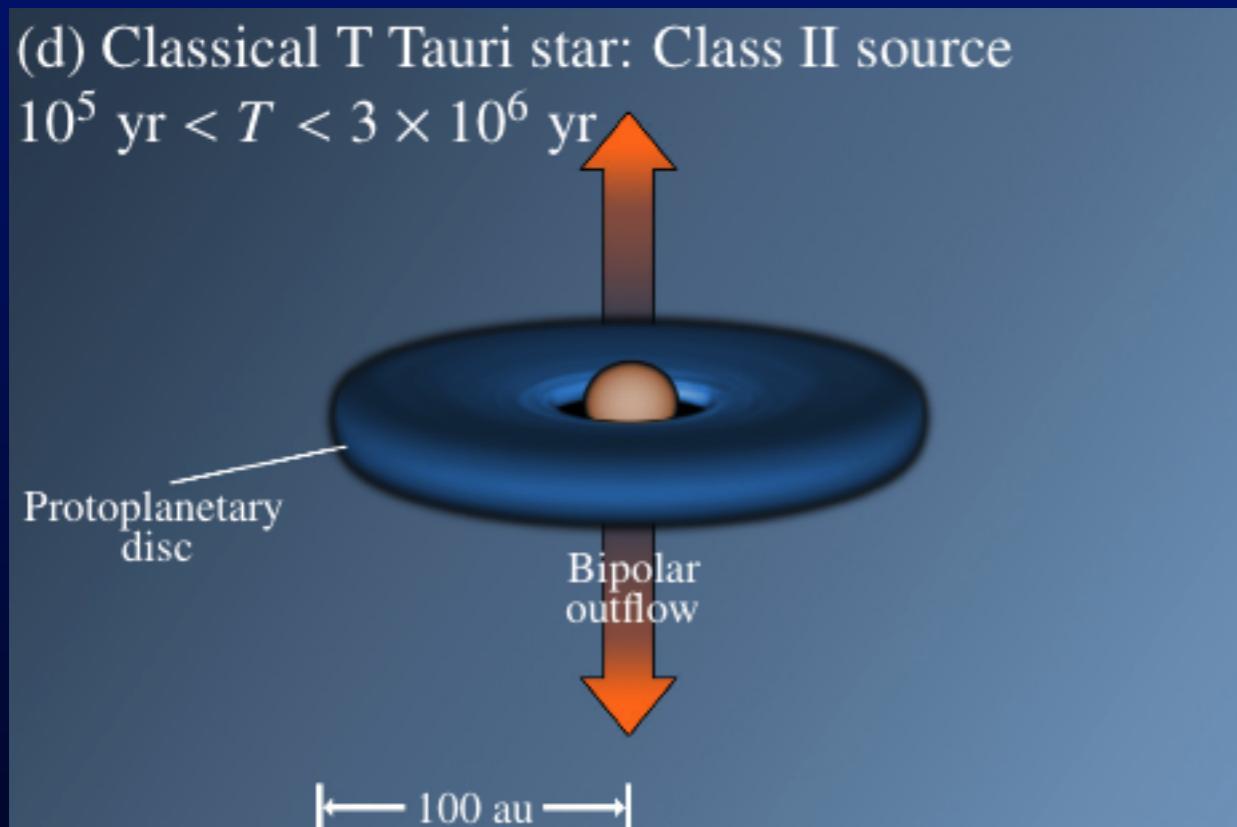

Figures from Alex Dunhill (PhD thesis, 2013) & Armitage (2010)

Class I: $\alpha_{\text{IR}} \gtrsim 0.0$

SED Classification Scheme

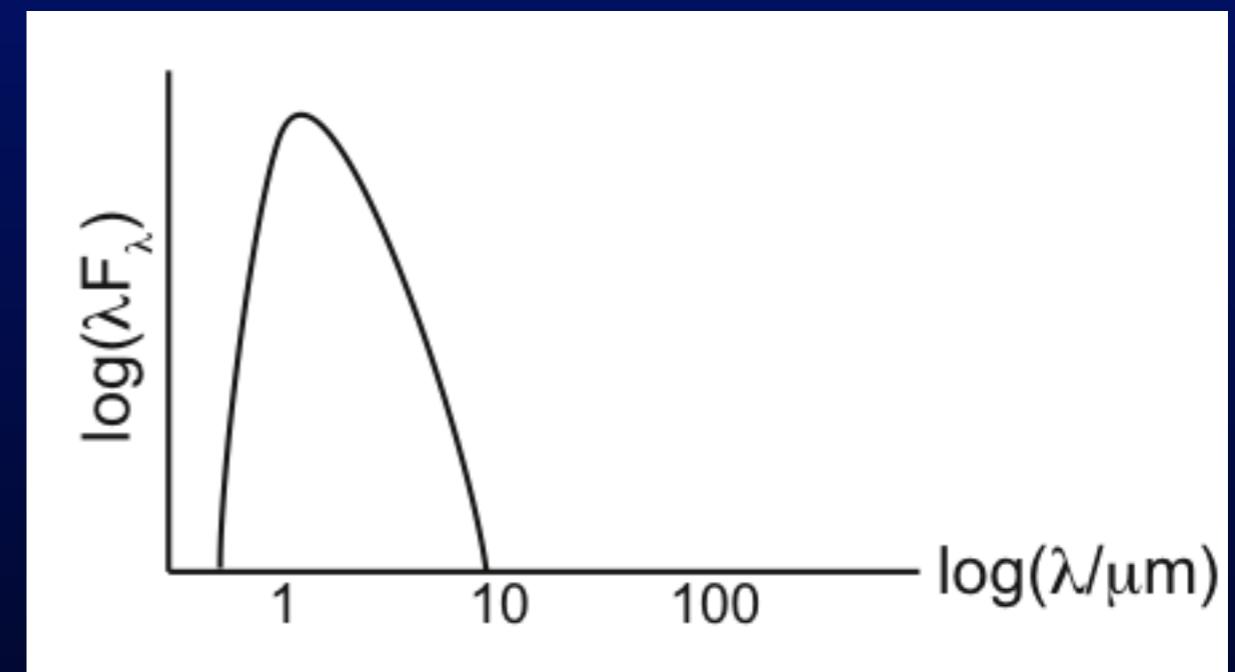

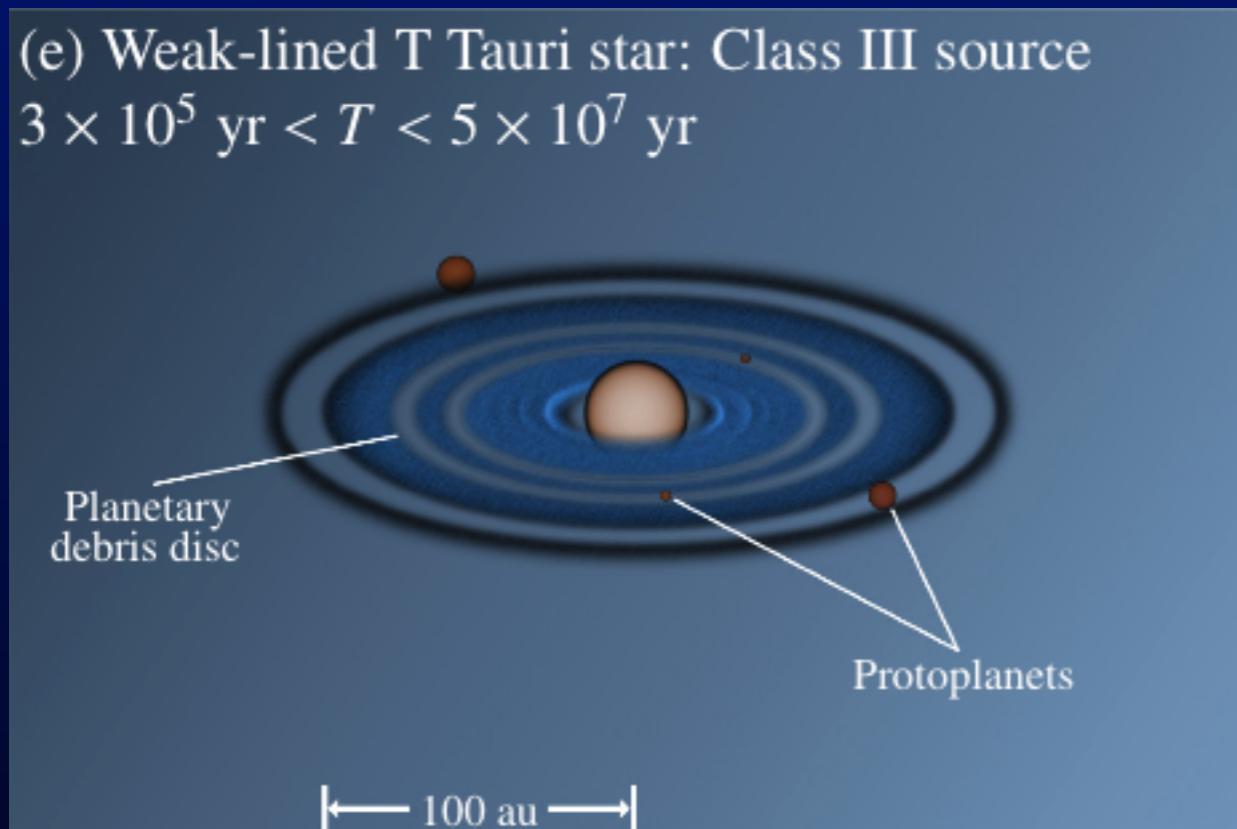

Figures from Alex Dunhill (PhD thesis, 2013) & Armitage (2010)

Class II: $-1.5 \lesssim \alpha_{\text{IR}} \lesssim 0.0$

SED Classification Scheme

Figures from Alex Dunhill (PhD thesis, 2013) & Armitage (2010)

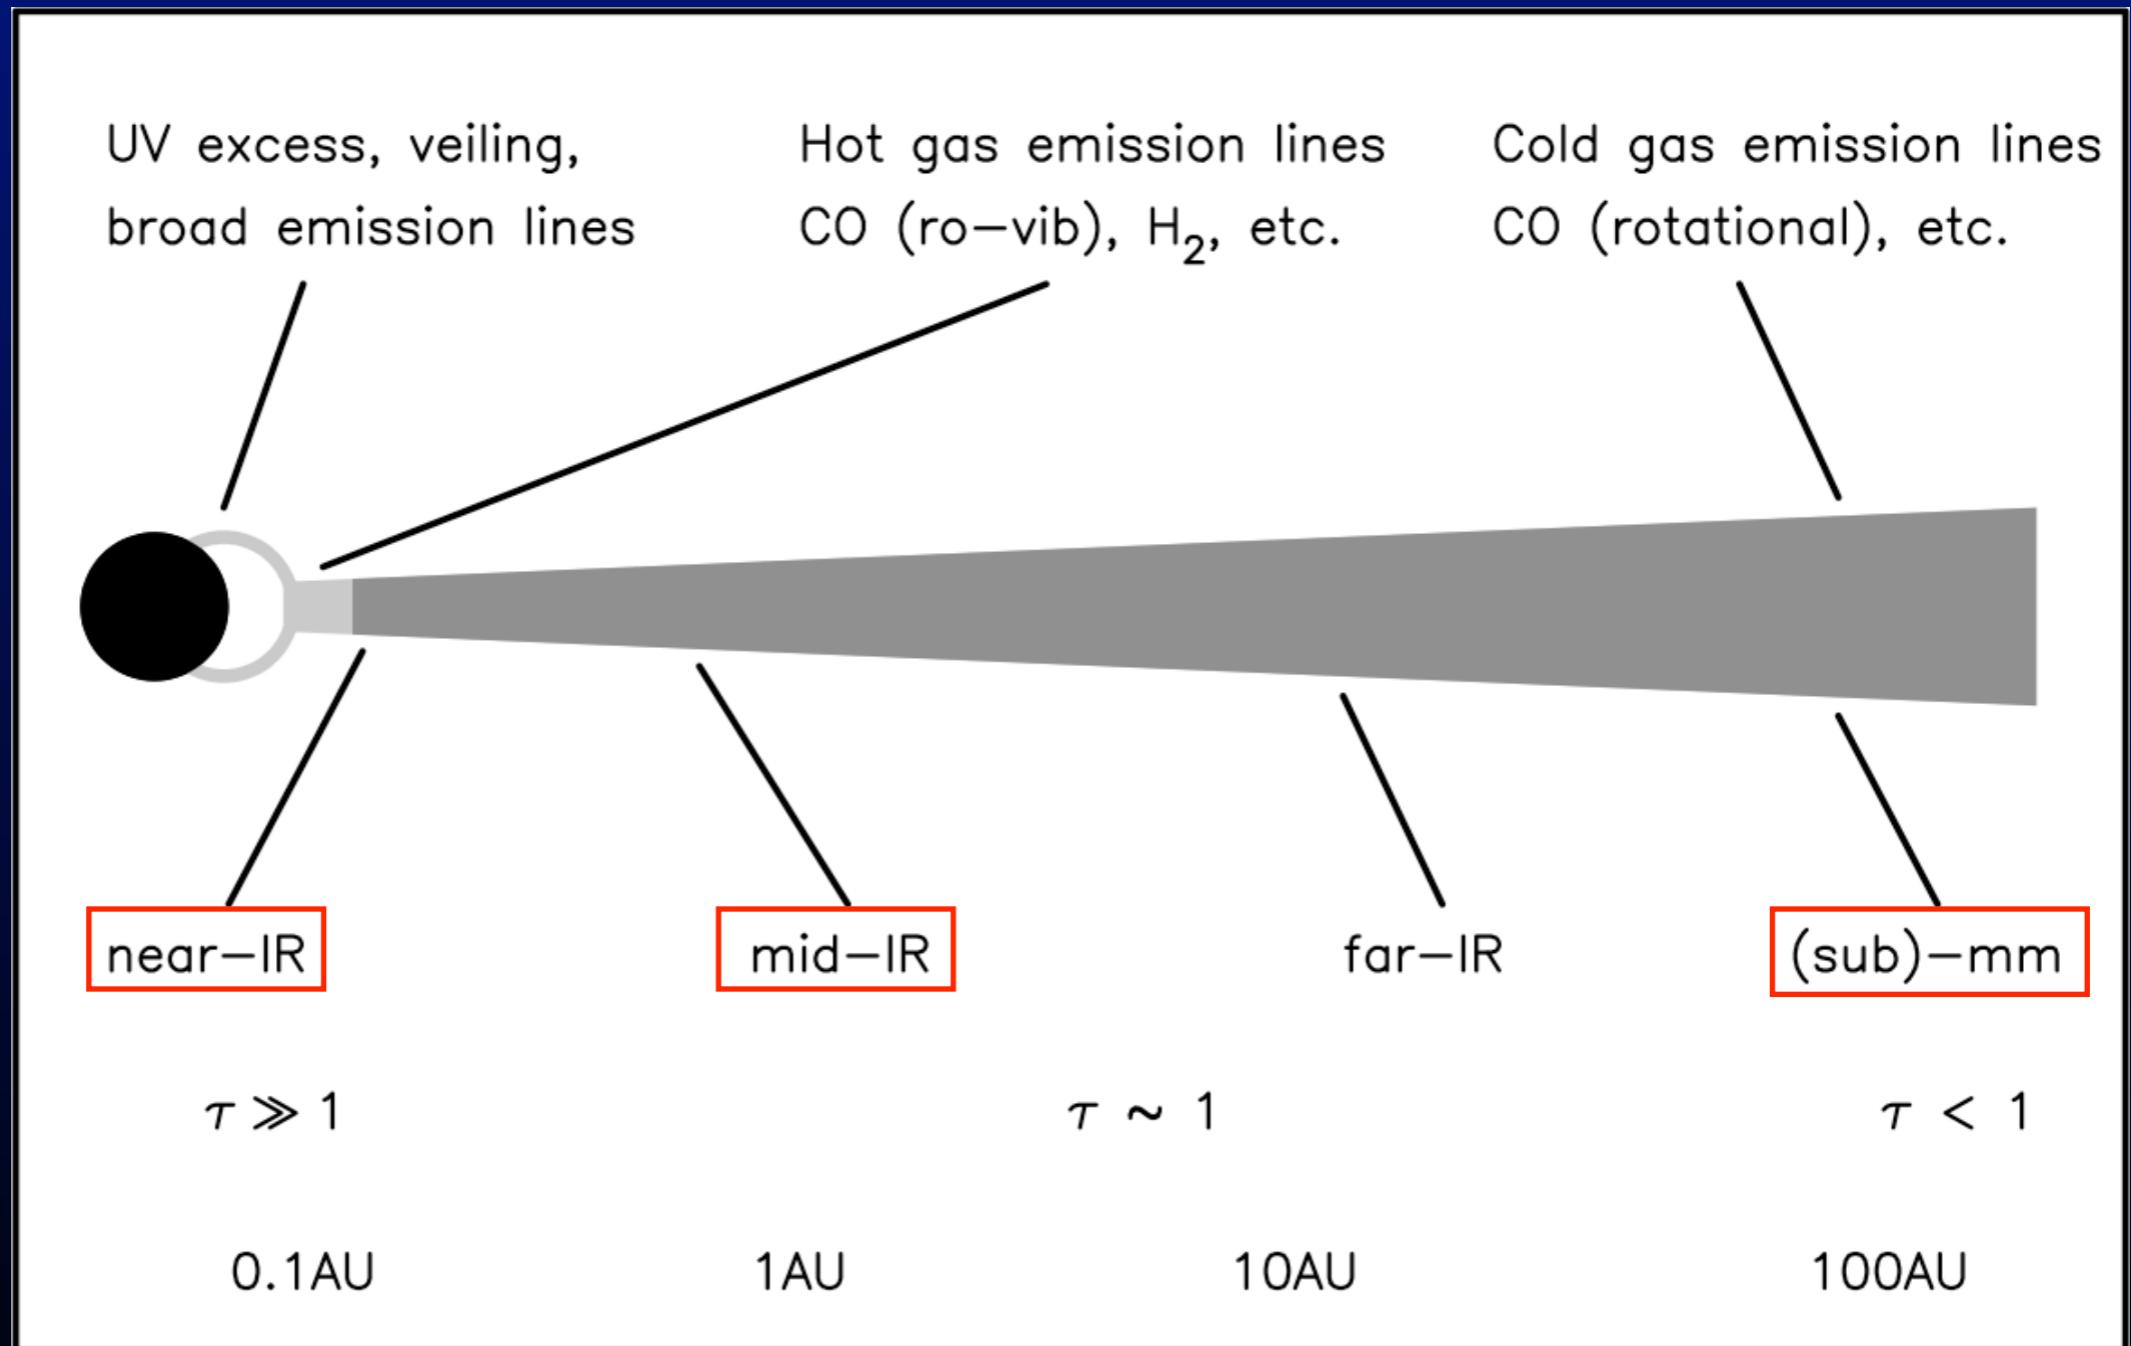

Class III: $\alpha_{\text{IR}} \sim -1.5$

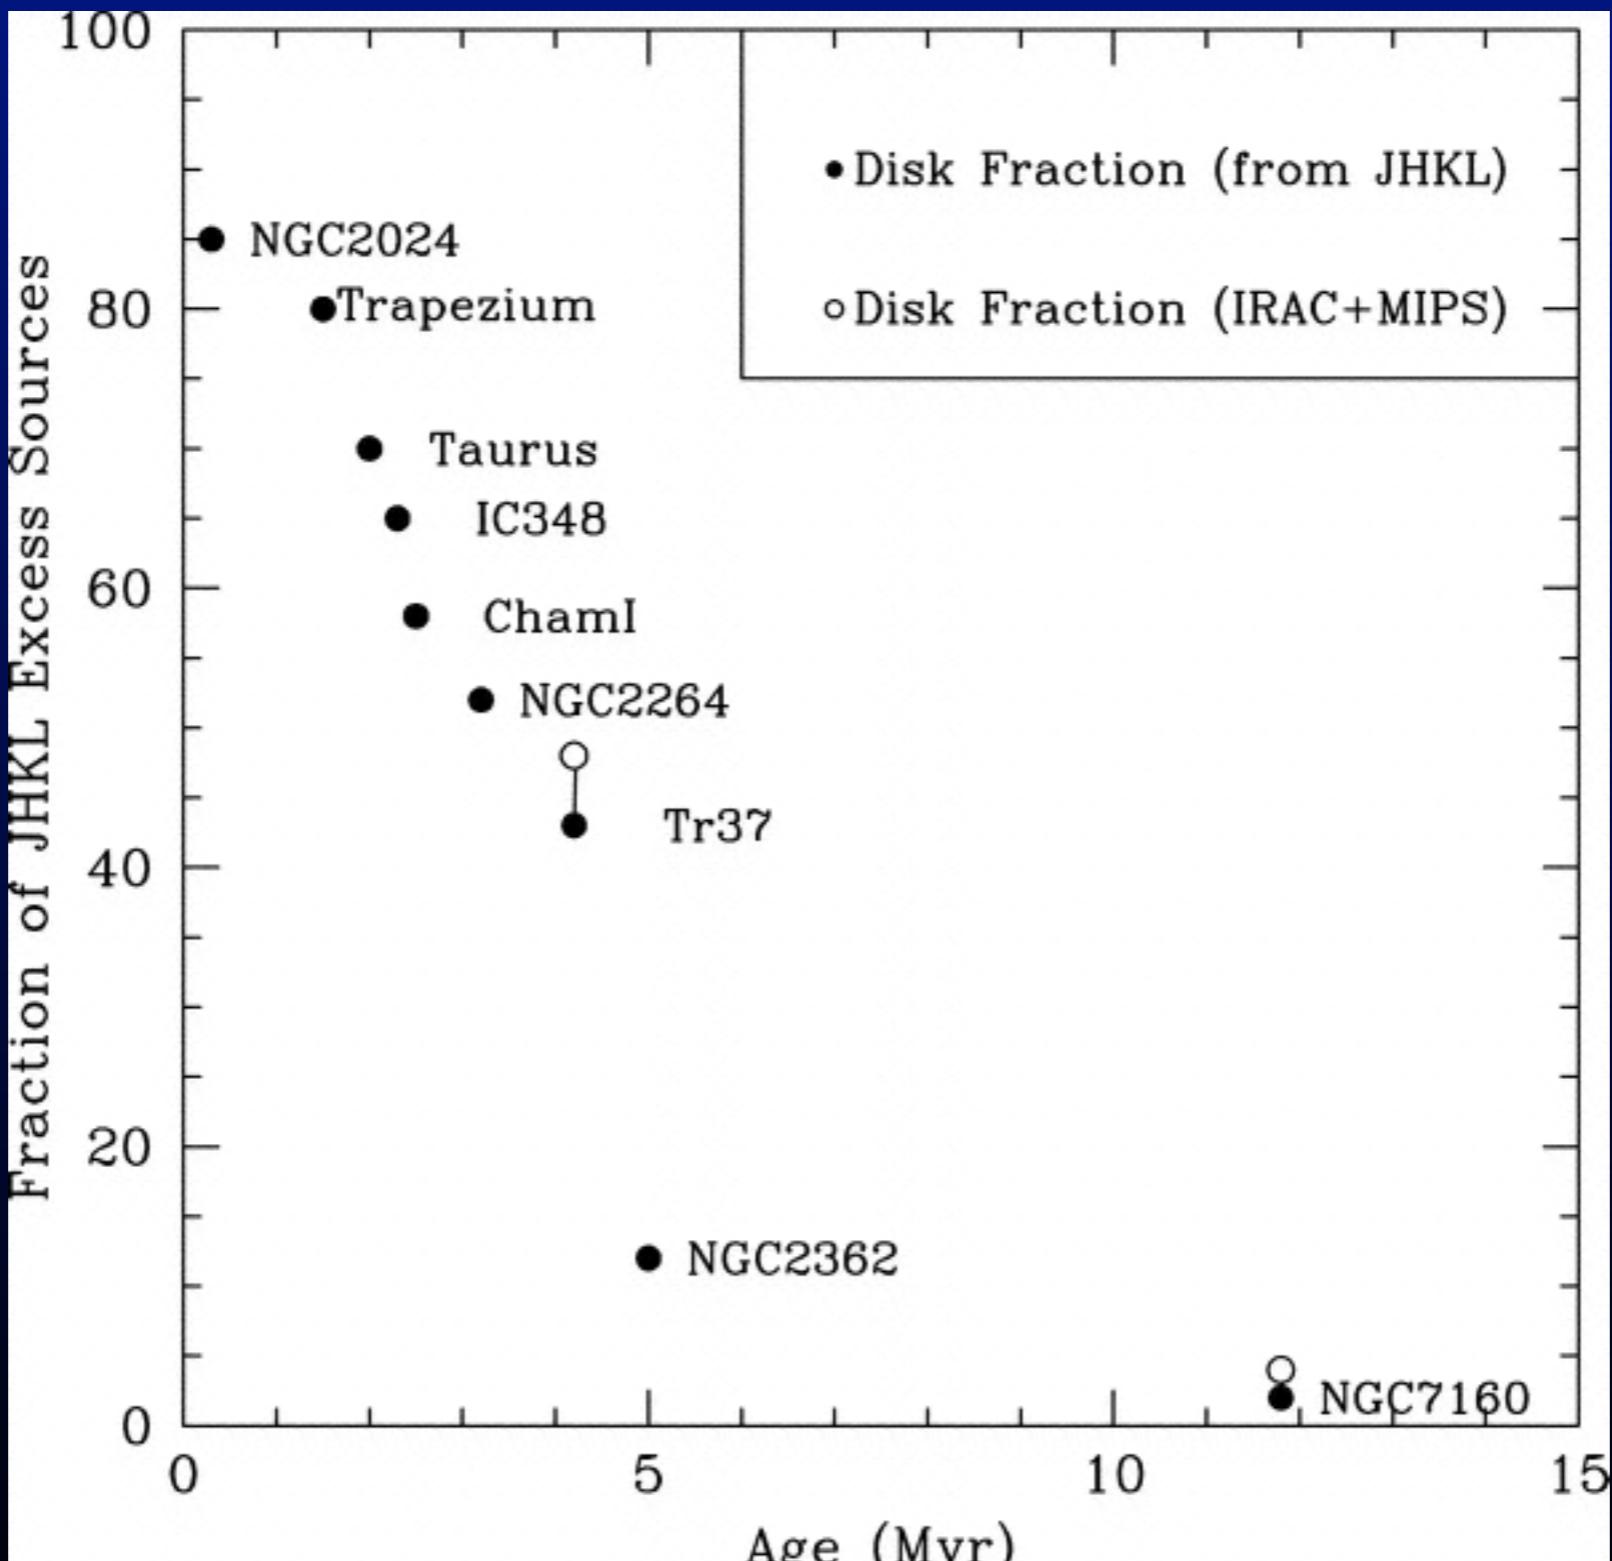

Observations of protoplanetary discs

GAS

DUST

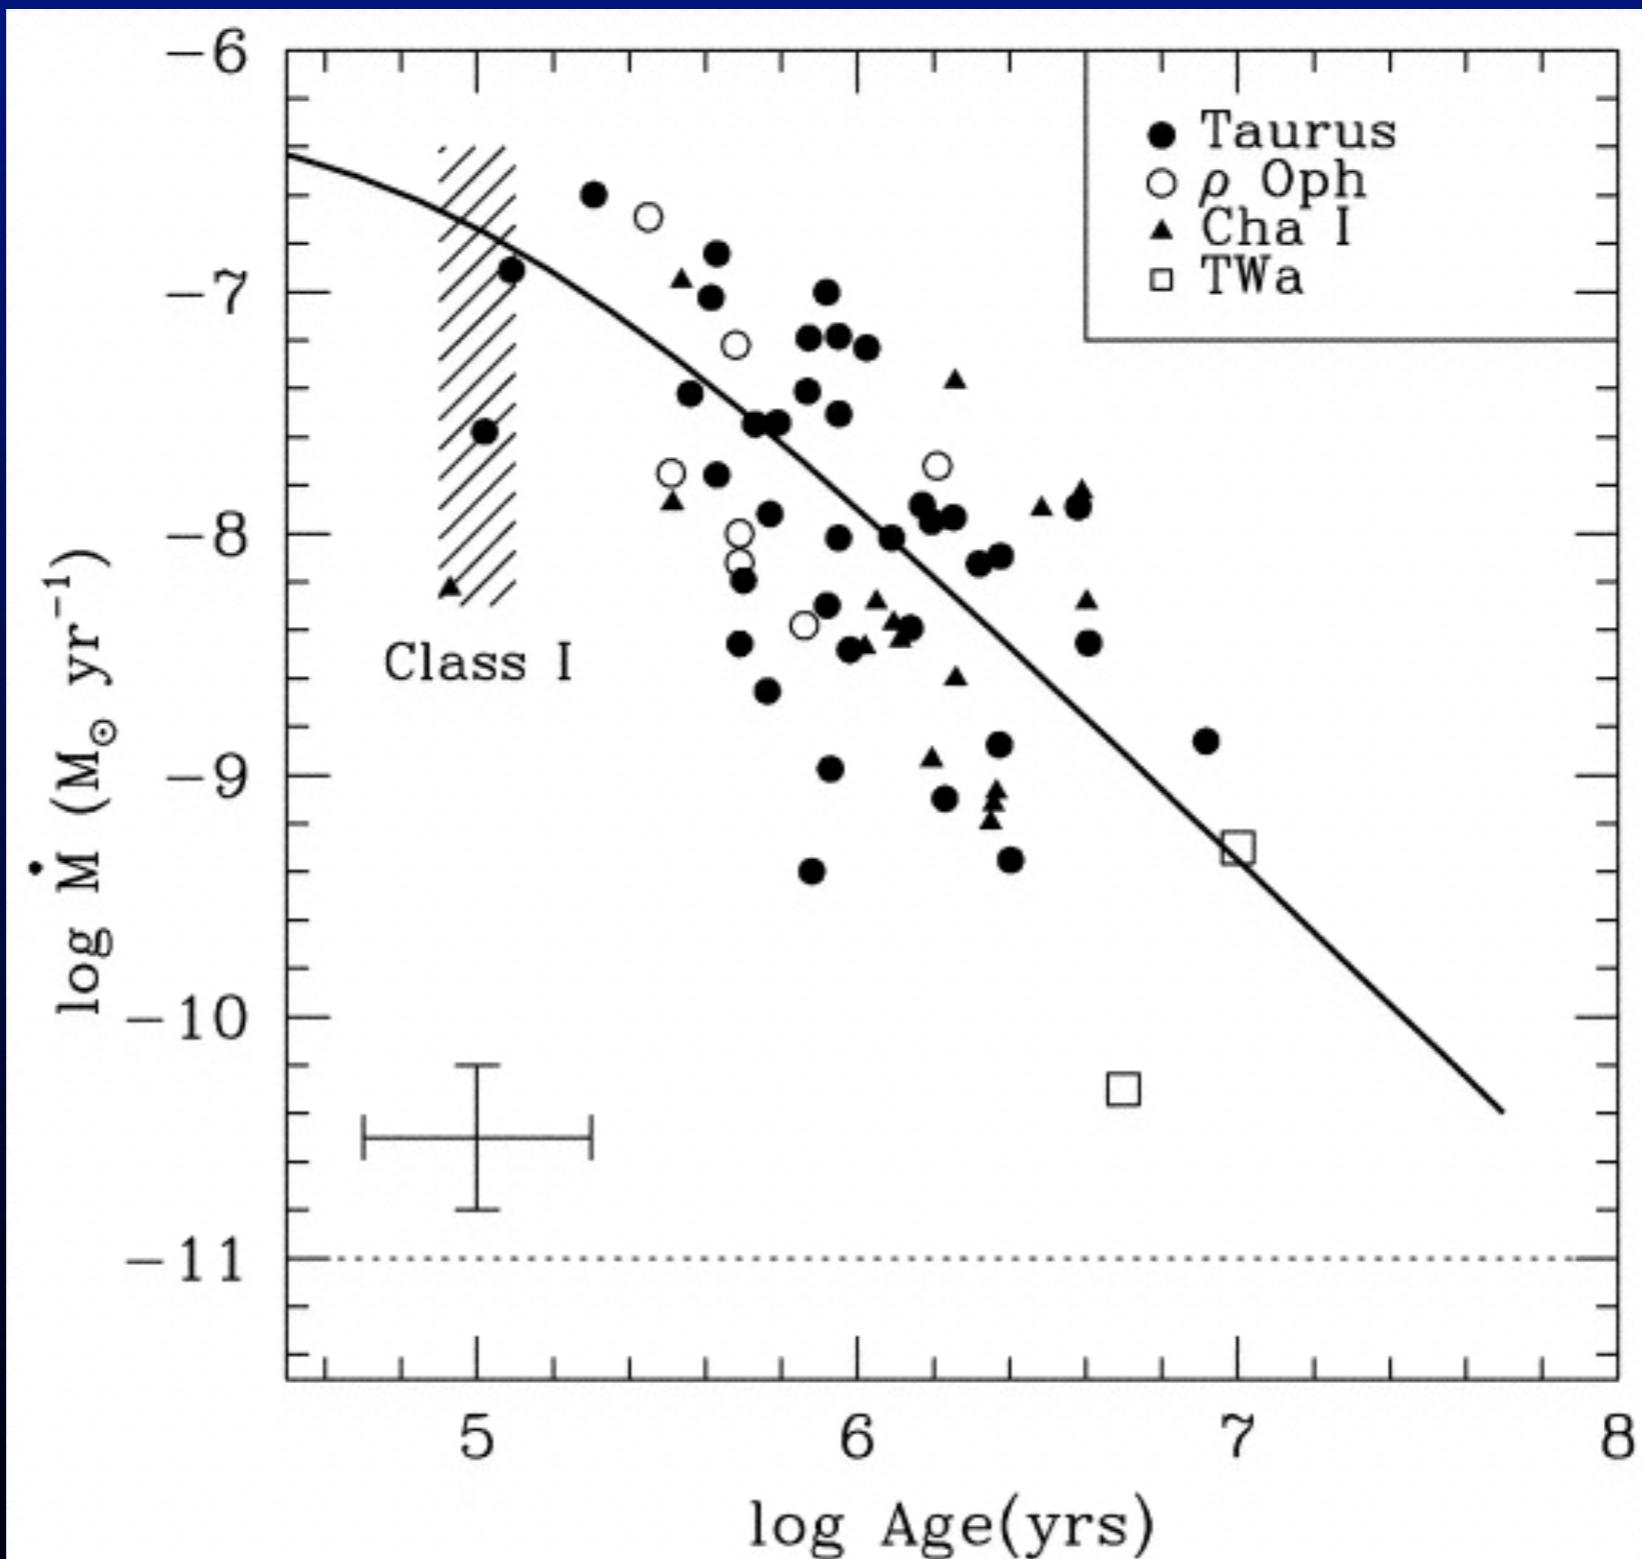

Disc lifetimes

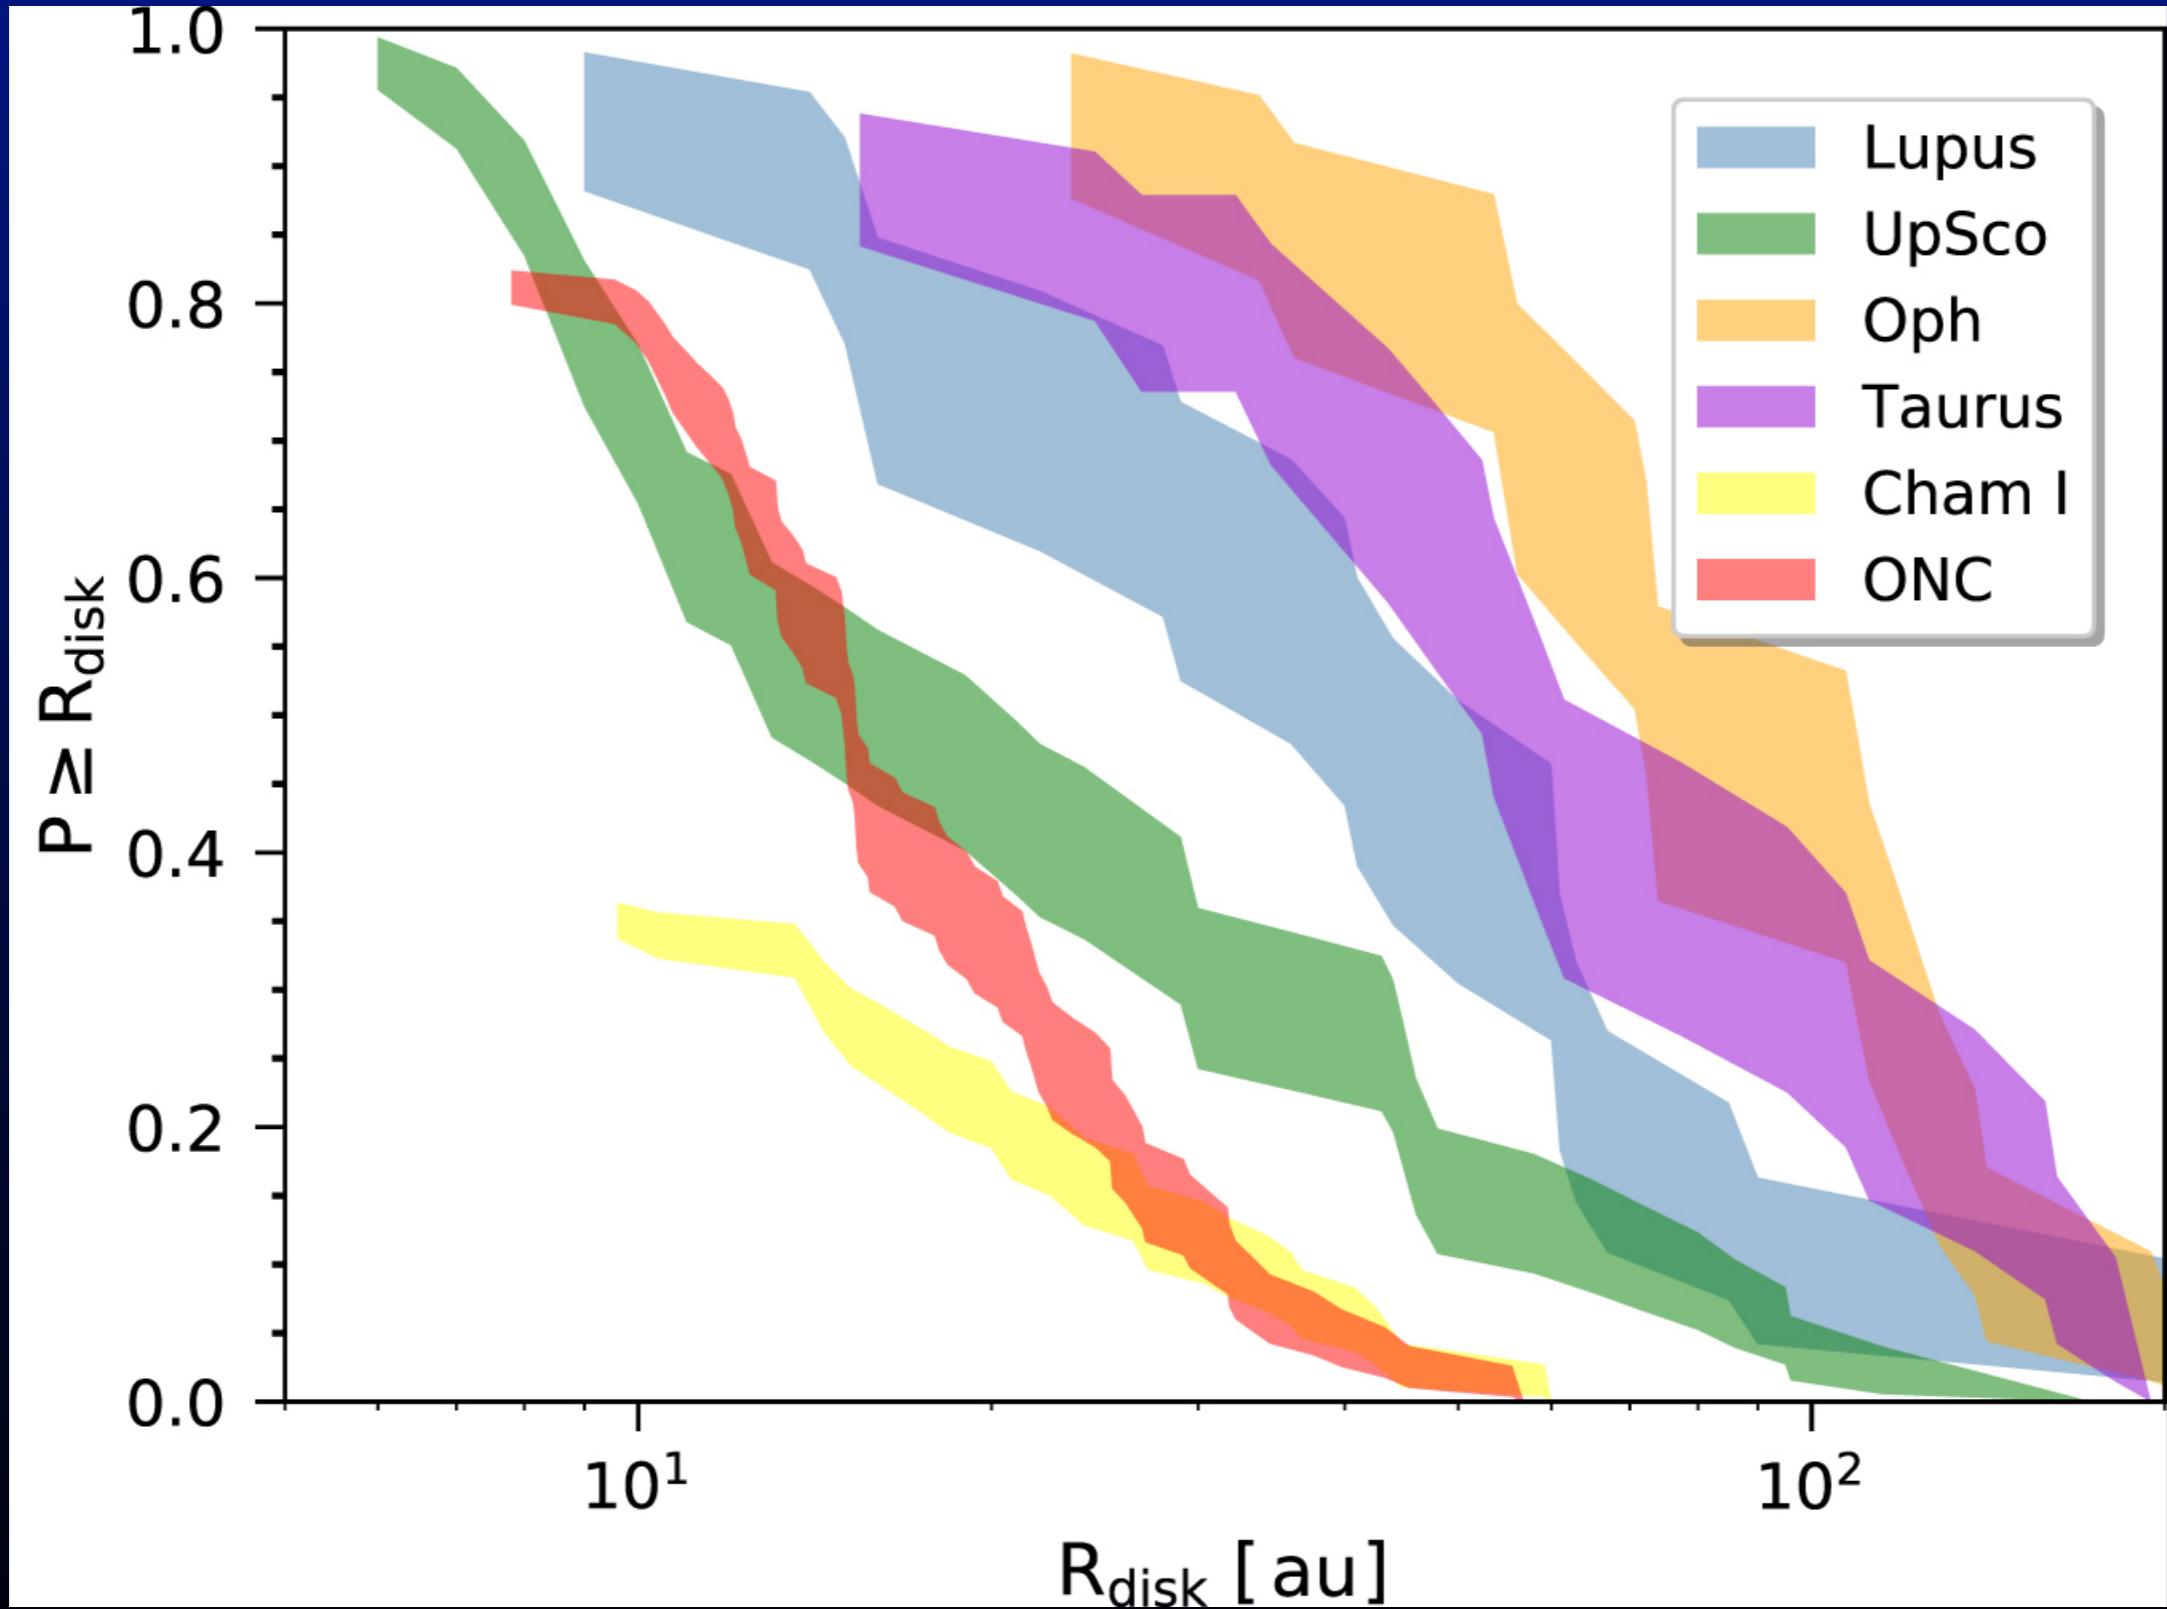

Sicilia-Aguilar et al. (2006)

Accretion rates

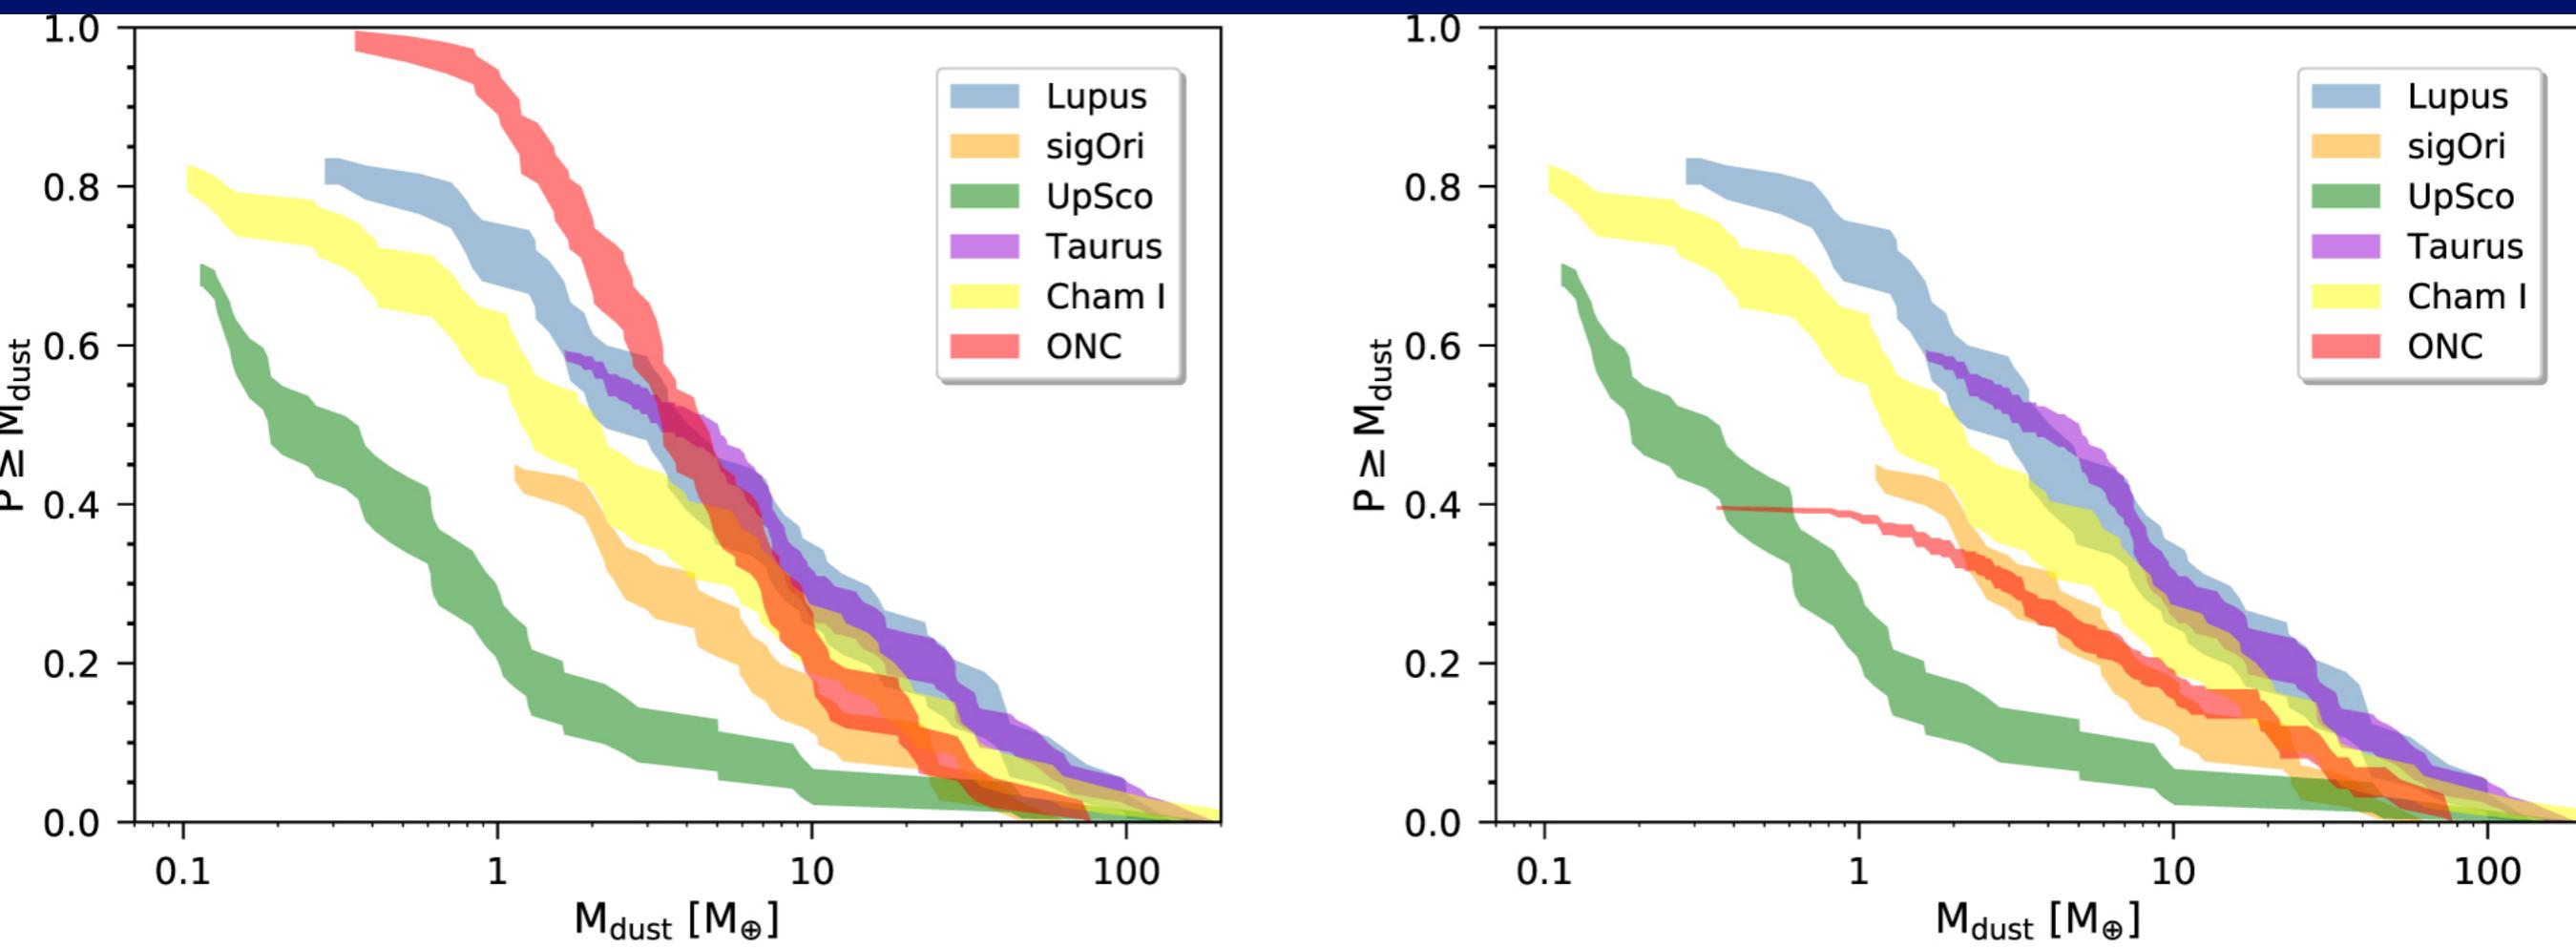

Muzerolle et al. (2000)

Disc sizes

Data compilation from Eisner et al. (2018)

Disc masses

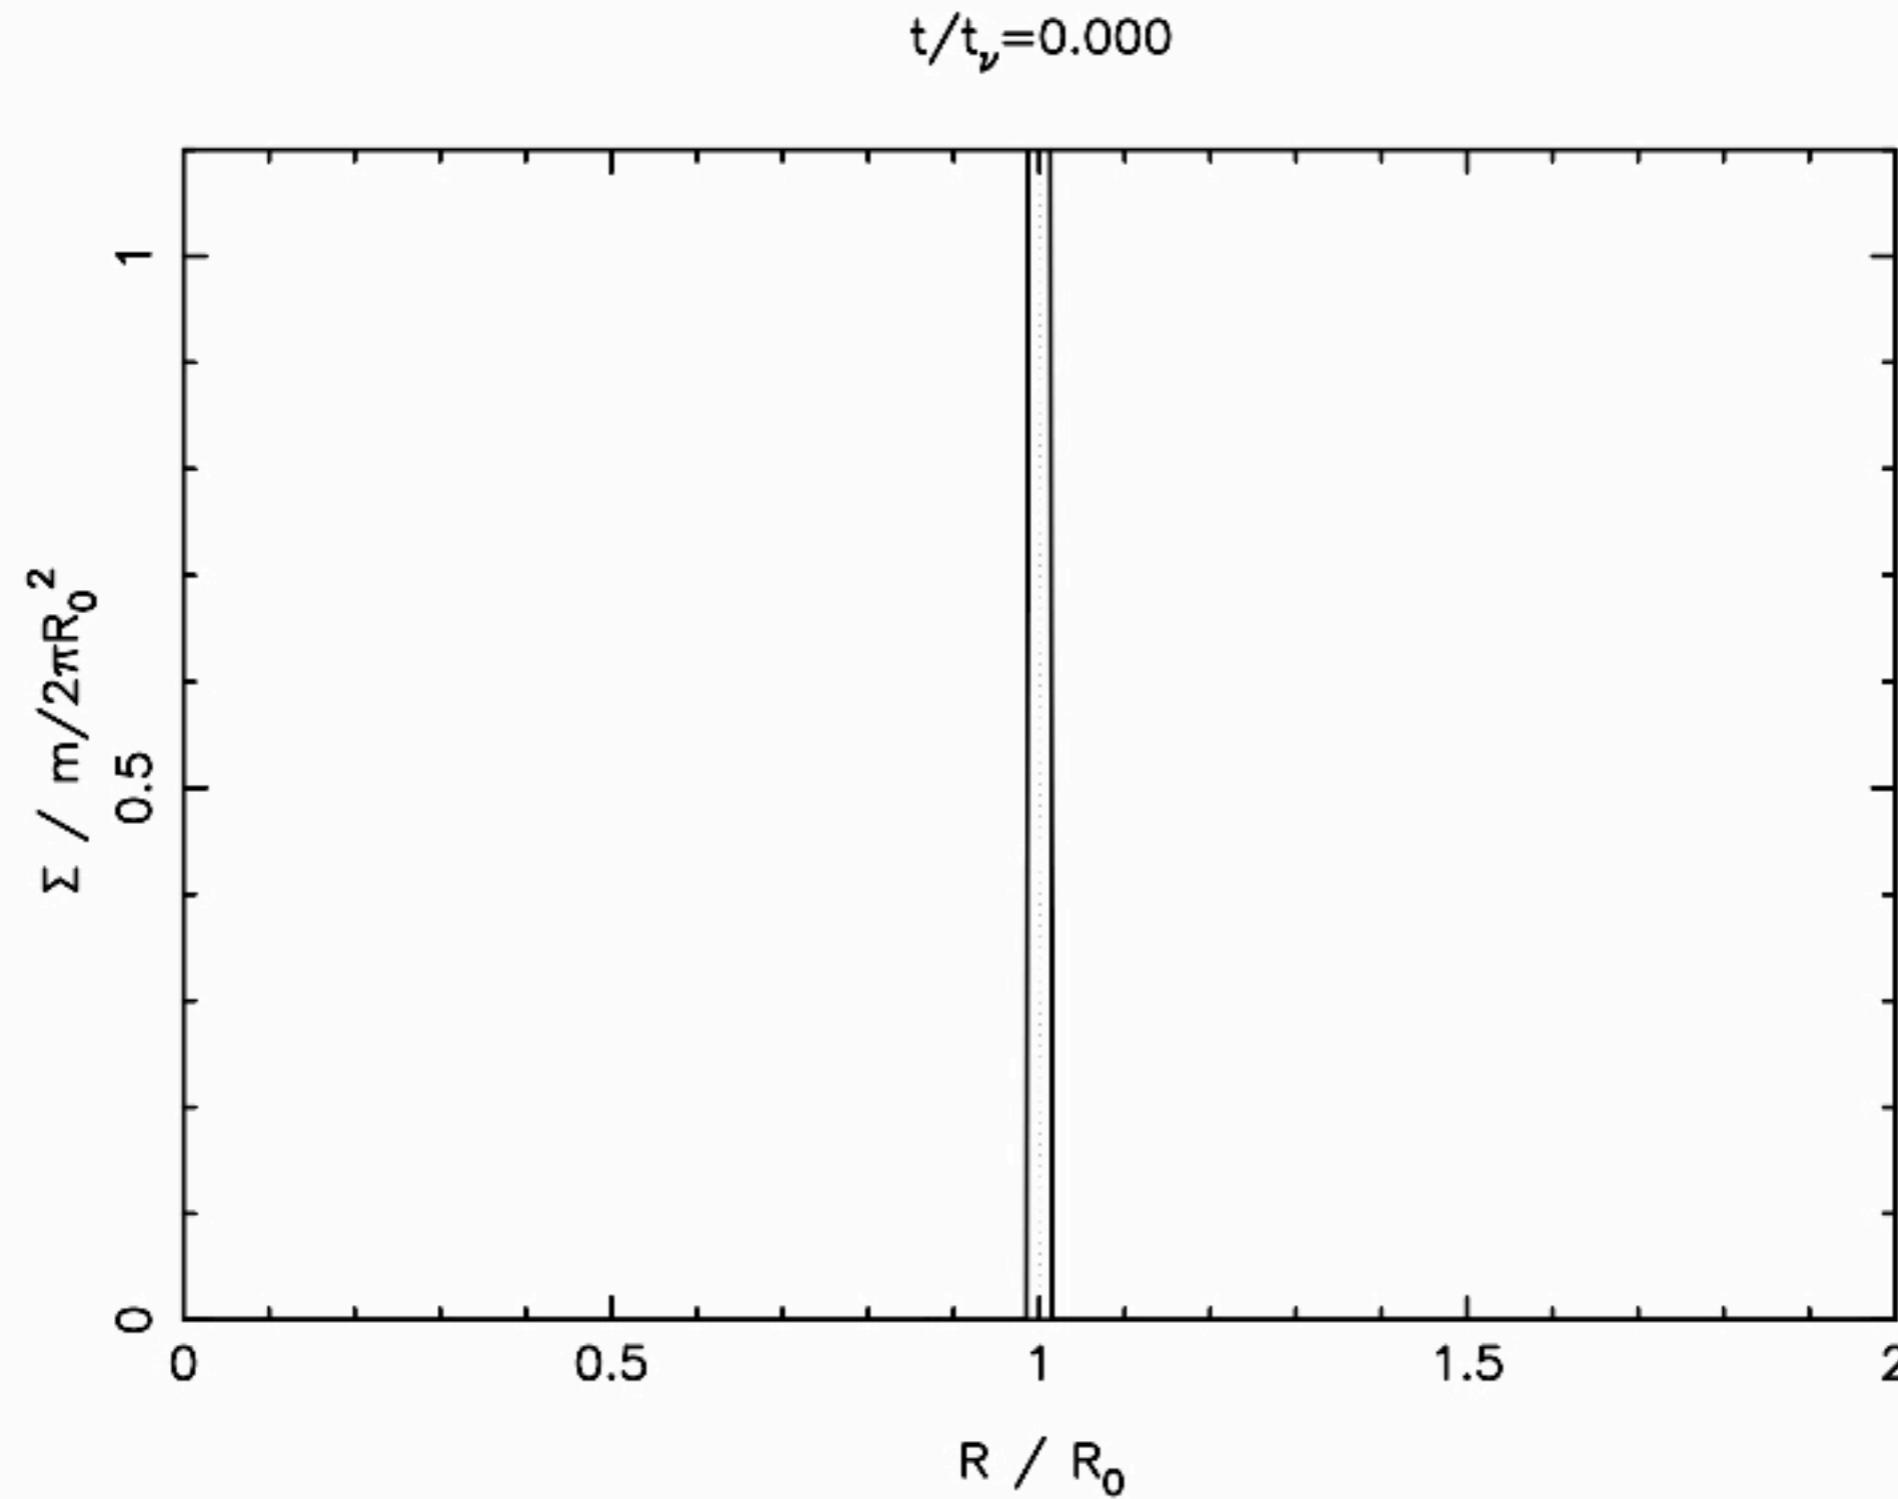

Data compilation from Eisner et al. (2018)

Observational Summary

- Discs are tens to hundreds of AU in size.
- Disc masses range from $>0.1M_{\odot}$ to $\leq 0.001M_{\odot}$.
- Accretion rates span $>10^{-7}M_{\odot}\text{yr}^{-1}$ to $\leq 10^{-10}M_{\odot}\text{yr}^{-1}$.
- Disc lifetimes are $\sim\text{Myr}$ (gas and dust tracers), with significant scatter.
- Cessation of (gas) accretion roughly simultaneous with (dust) disc clearing.
- Disc lifetimes set a limit on the time-scale for (giant) planet formation.
- Disc observations tell us the typical conditions for planet formation.

Viscous spreading ring

Pringle (1981)

Viscous disc similarity solution

Lynden-Bell & Pringle (1974)

$$\nu \propto R^\gamma$$

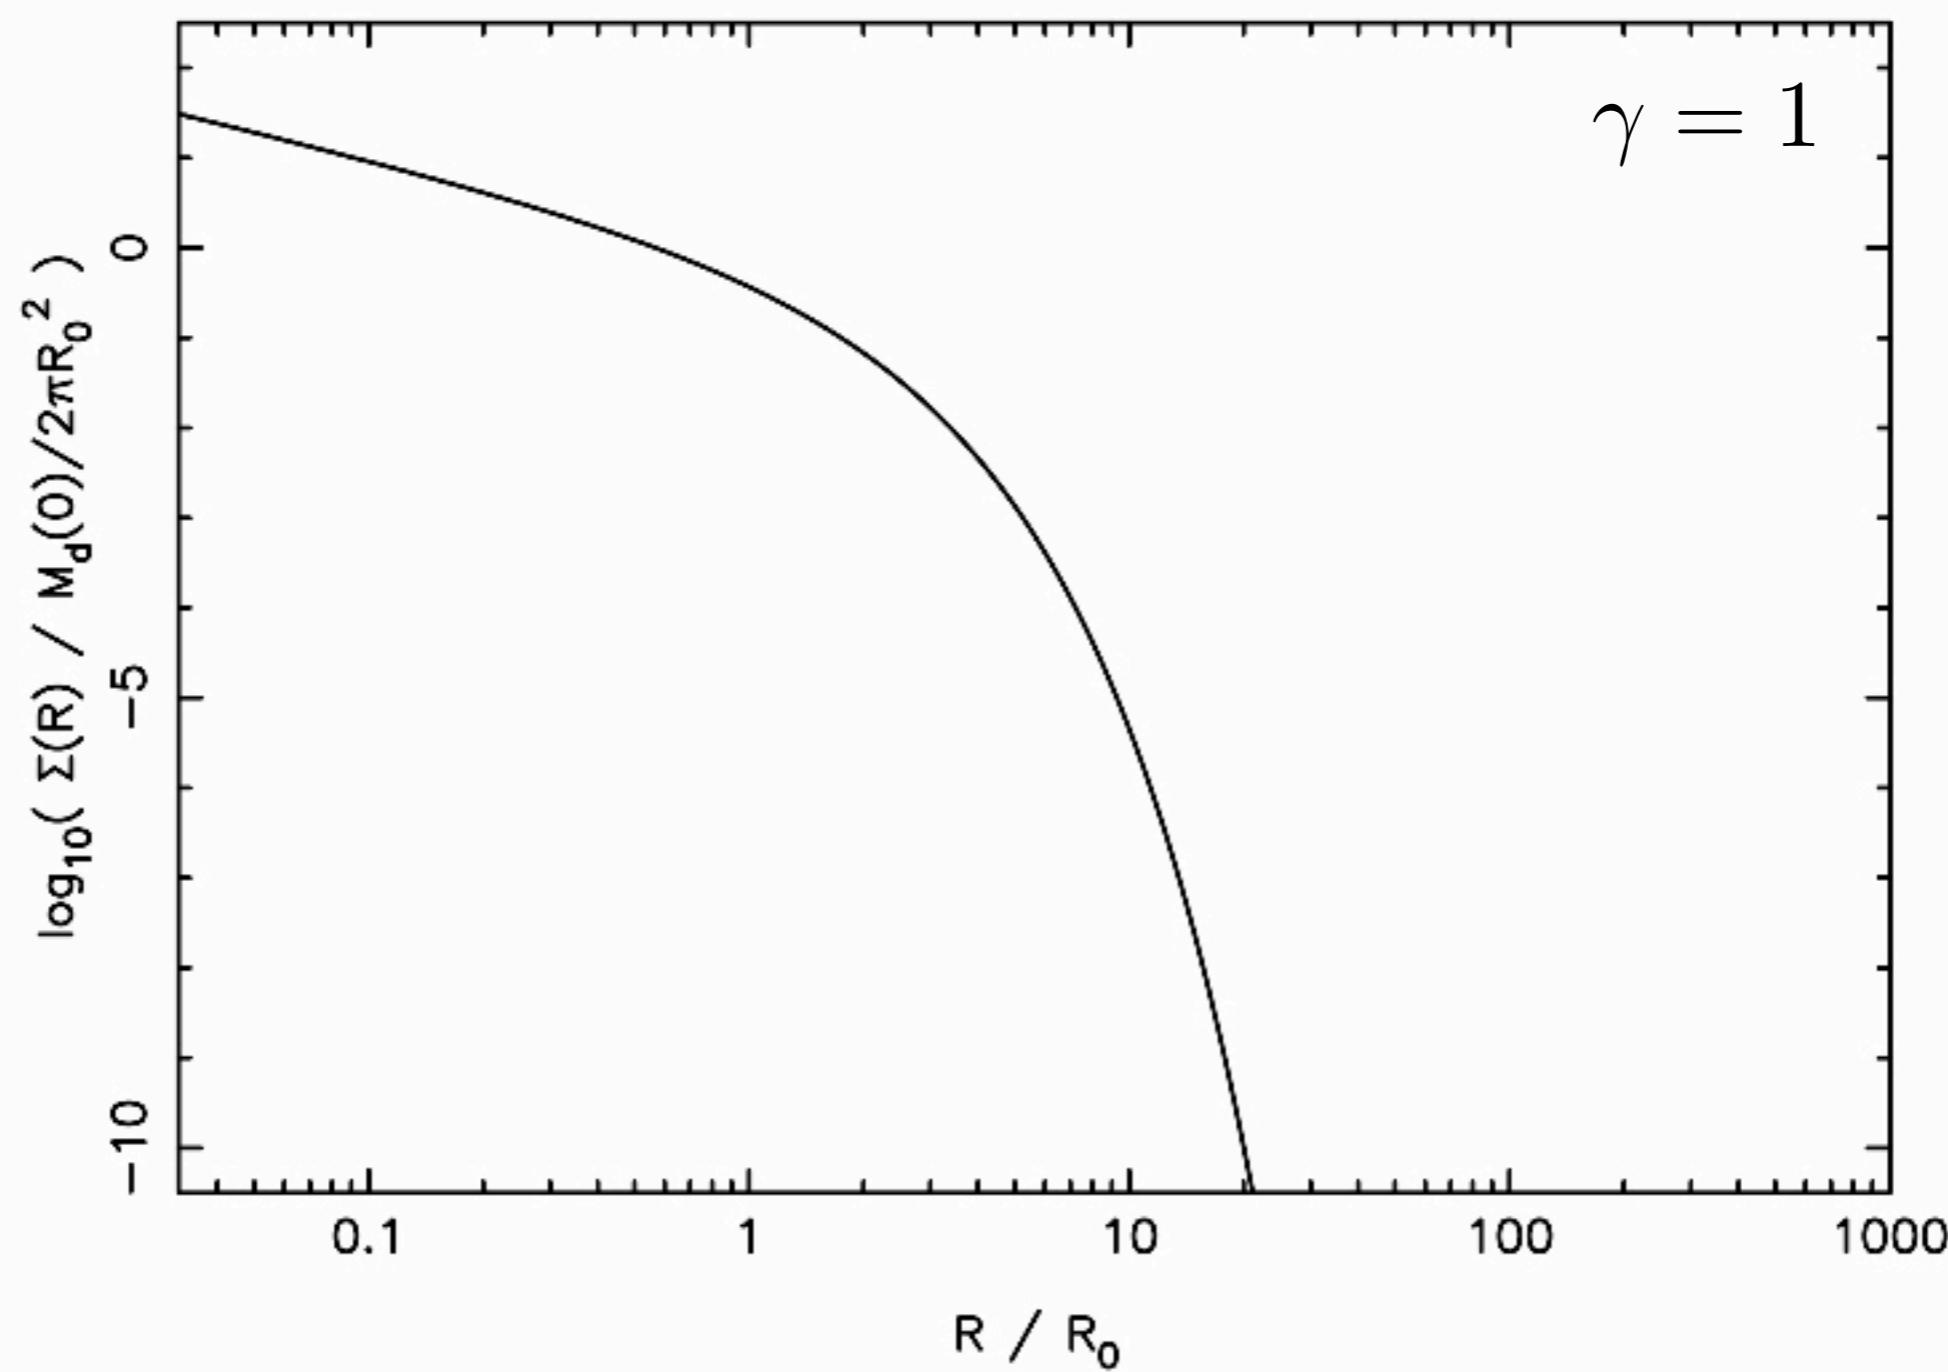

$$\Sigma(R, t) = \frac{M_d(0)(2 - \gamma)}{2\pi R_0^2 r^\gamma} \tau^{\frac{-(5/2-\gamma)}{2-\gamma}} \exp\left(-\frac{r^{2-\gamma}}{\tau}\right)$$

$$r = R/R_0 \quad \tau = t/t_\nu + 1 \quad t_\nu = \frac{R_0^2}{3(2 - \gamma)^2 \nu_0}$$

$$\dot{M}_{acc} = \frac{M_d(0)}{2(2 - \gamma)t_\nu} \tau^{\frac{-(5/2-\gamma)}{2-\gamma}}$$

Viscous disc similarity solution

Lynden-Bell & Pringle (1974)

Disc stability criteria

- Purely hydrodynamic disc (Rayleigh). Unstable if:

$$\kappa^2 = \frac{2\Omega}{R} \frac{d}{dR} (R^2 \Omega) < 0$$

- MHD disc. Unstable if:

$$(\mathbf{k} \cdot \mathbf{u}_A)^2 + \frac{d\Omega^2}{d \ln R} < 0$$

- Alfvén velocity:

$$u_A = \sqrt{B^2 / 4\pi\rho}$$

- In limit $B \rightarrow 0$ (weak B-field), unstable if:

$$\frac{d\Omega^2}{d \ln R} < 0$$

The magnetorotational instability

Local simulations (ideal MHD)

Animation courtesy of Anders Johansen (Lund)

Global simulations (ideal MHD)

Accretion and Outflows in 3D Global MHD Simulations of Stratified Protoplanetary Disk

*Mario Flock
Ringberg 2011*

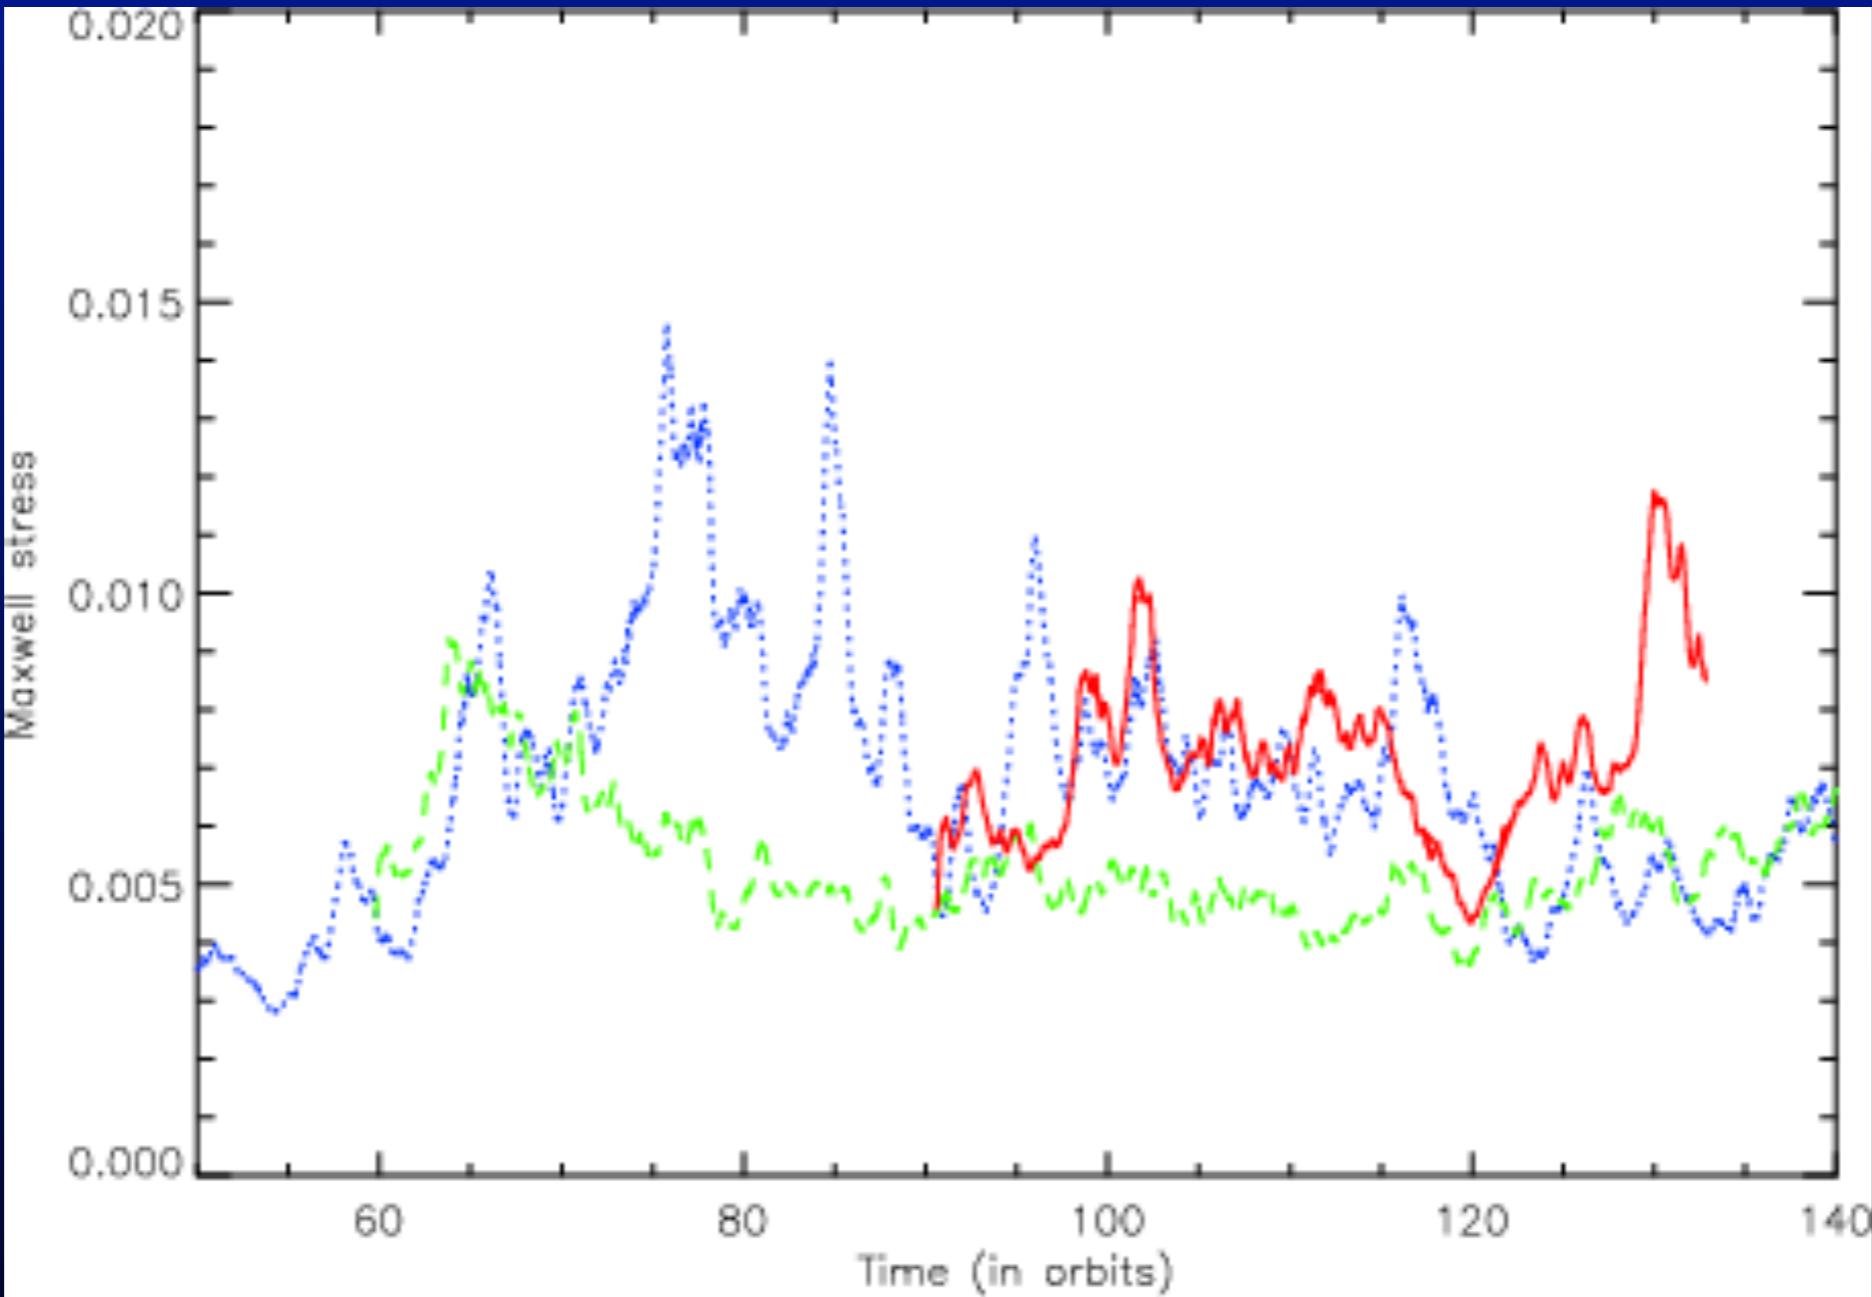

Figure from Fromang (2010)

Numerical simulations suggest that MRI turbulence can drive angular momentum transport with an “effective alpha” value $\alpha \sim 0.01$.

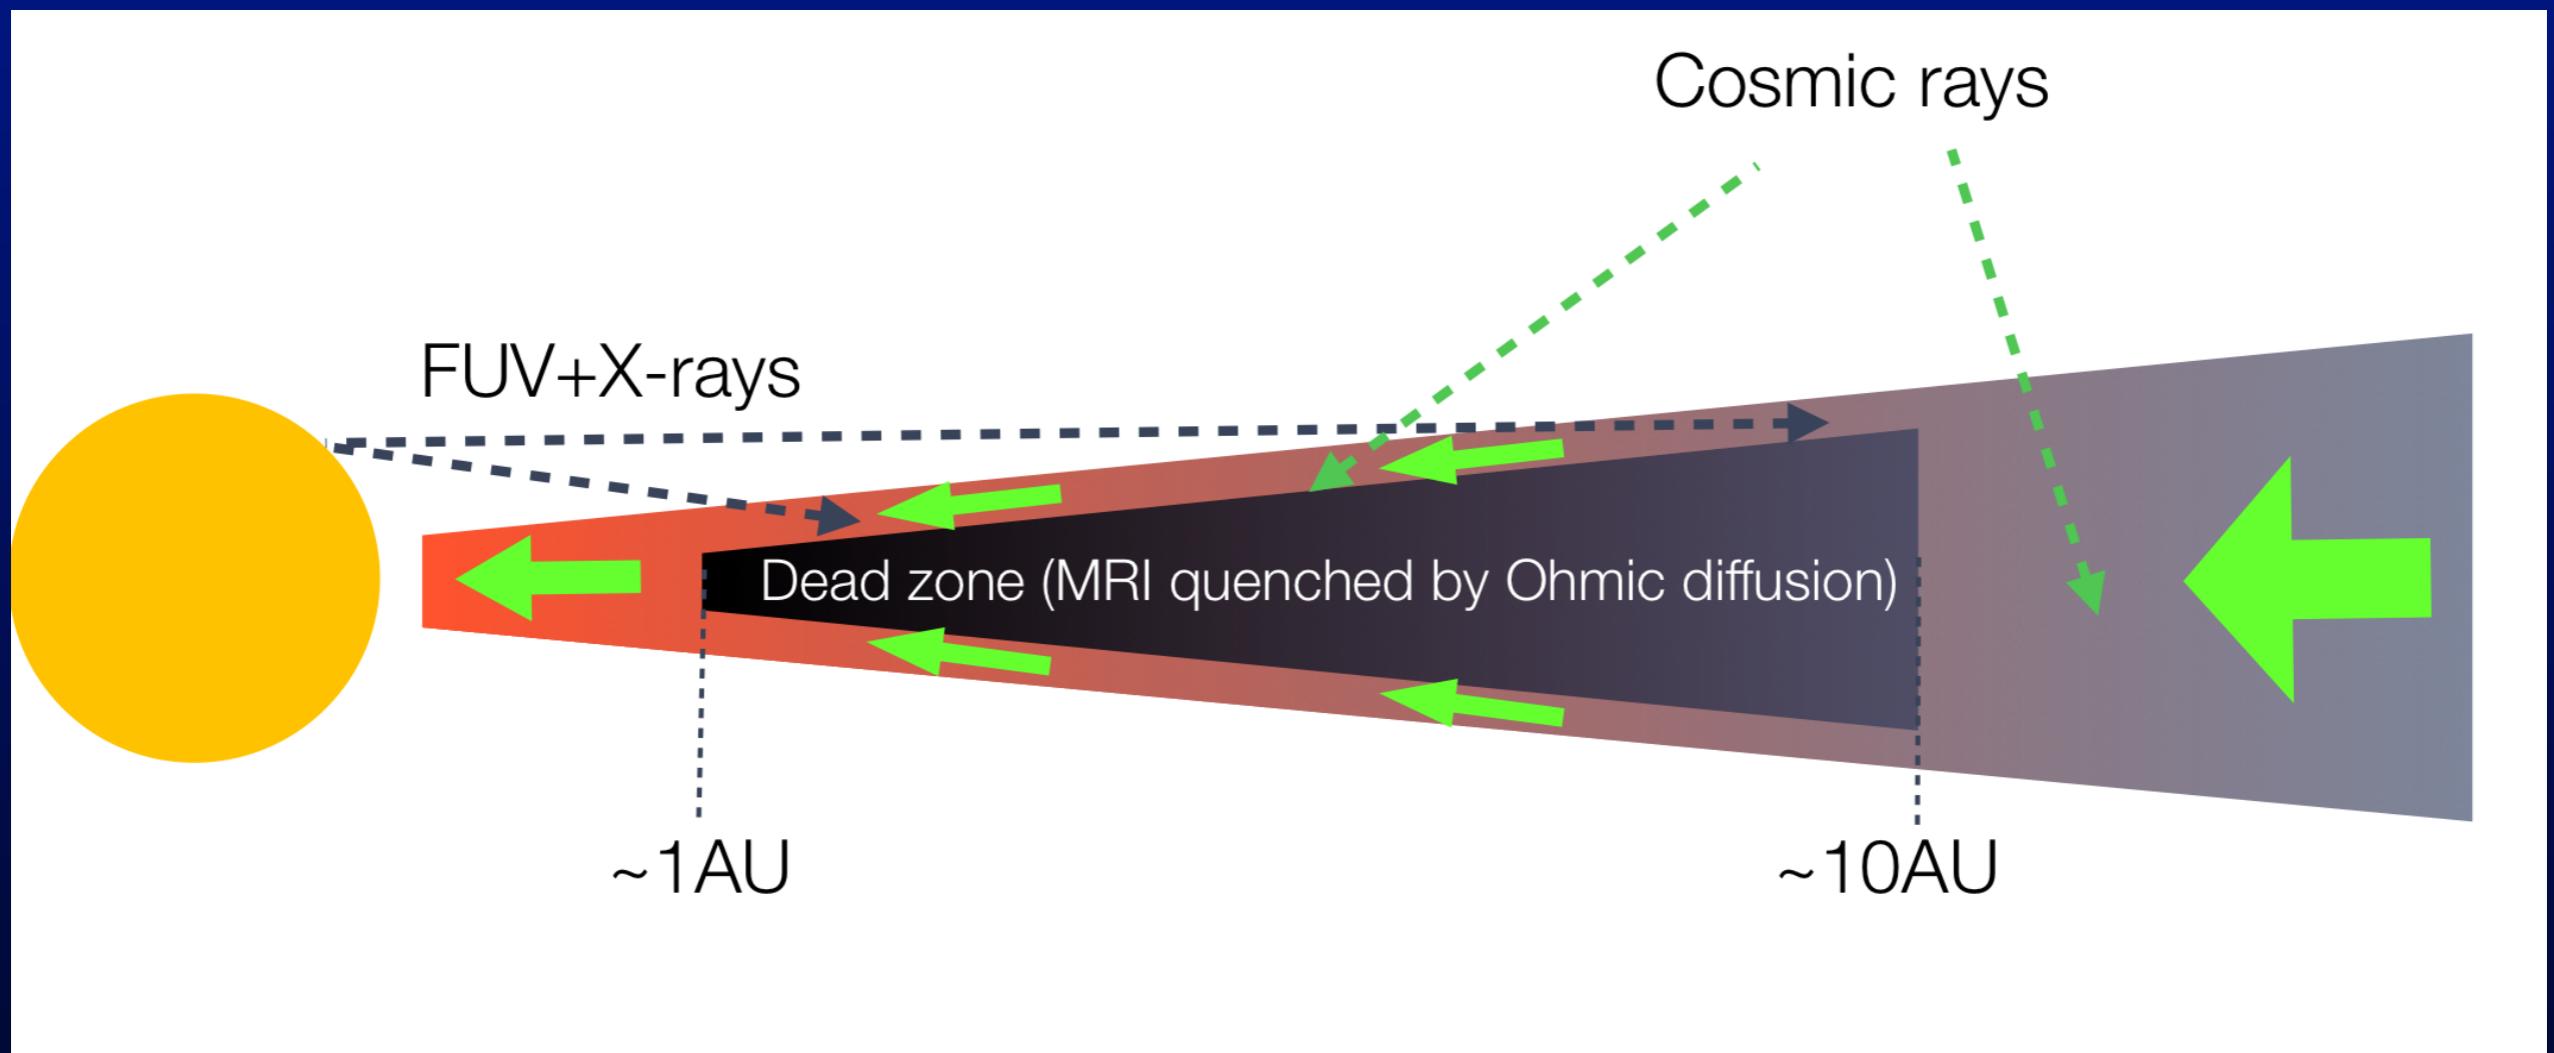

Figure from Geoffroy Lesur (PP6 talk), after Gammie (1996)

MRI requires that disc be partially ionized ($\sim 10^{-12}$).
The midplane regions of protoplanetary discs may be
“MRI dead”, resulting in a layered disc structure.

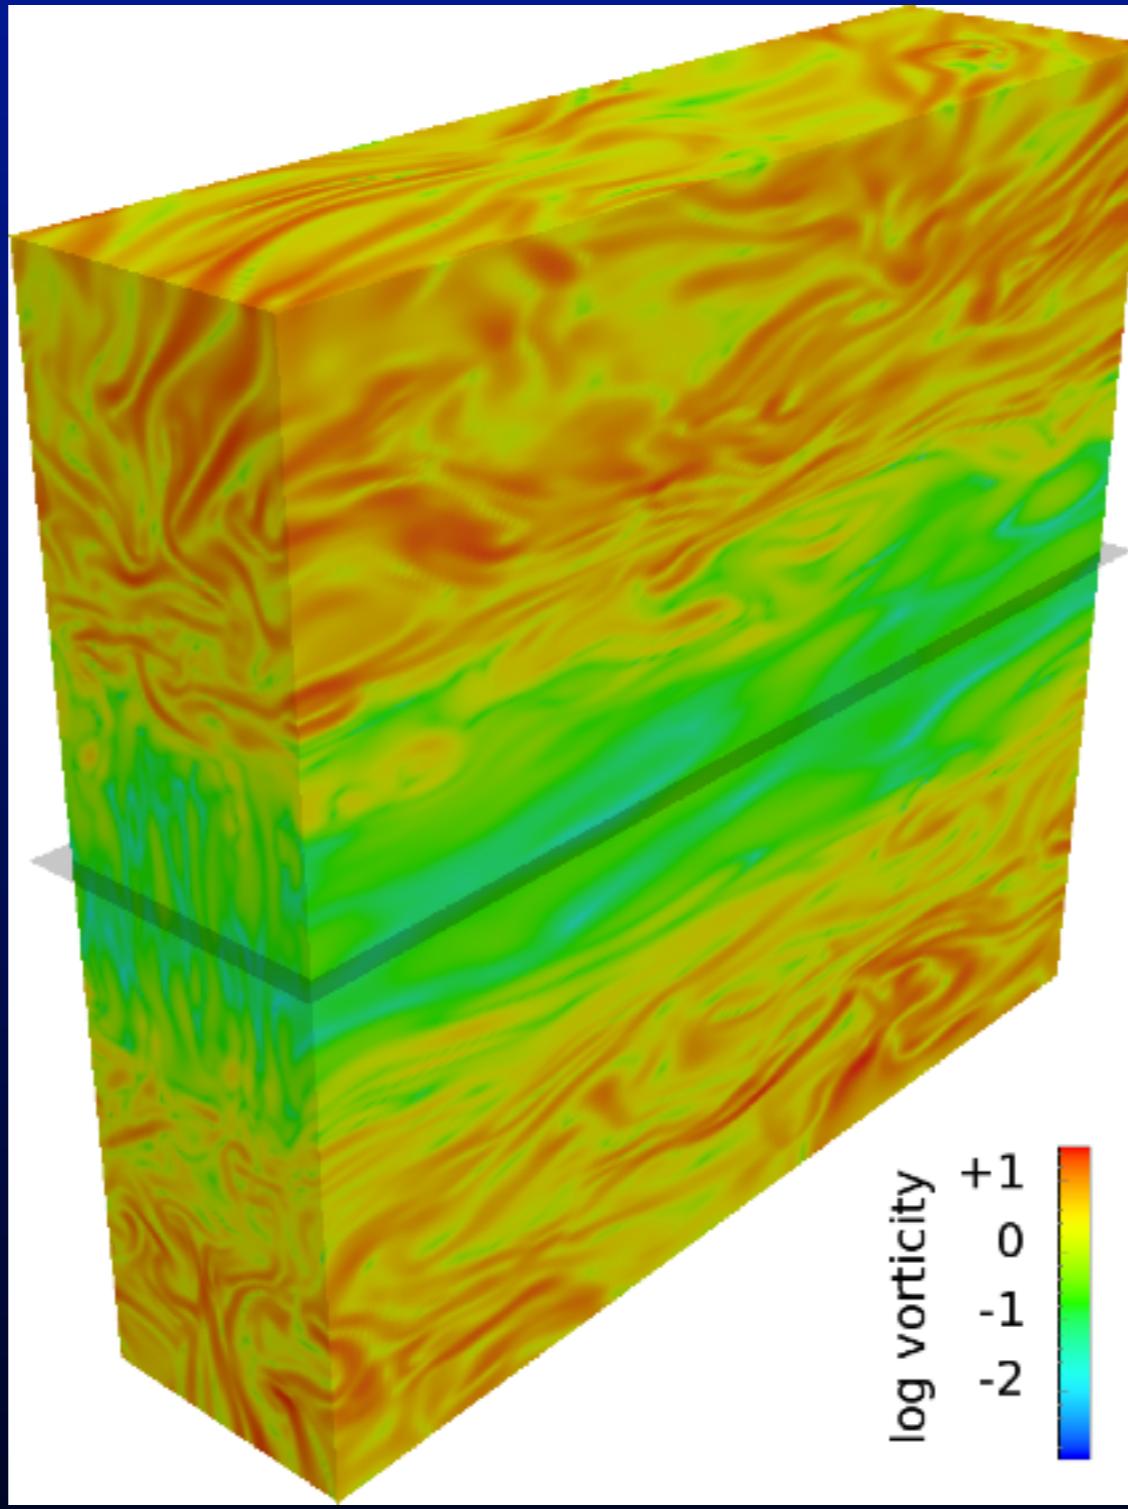

Figure from Gressel, Nelson & Turner (2011)

MRI requires that disc be partially ionized ($\sim 10^{-12}$).
The midplane regions of protoplanetary discs may be
“MRI dead”, resulting in a layered disc structure.

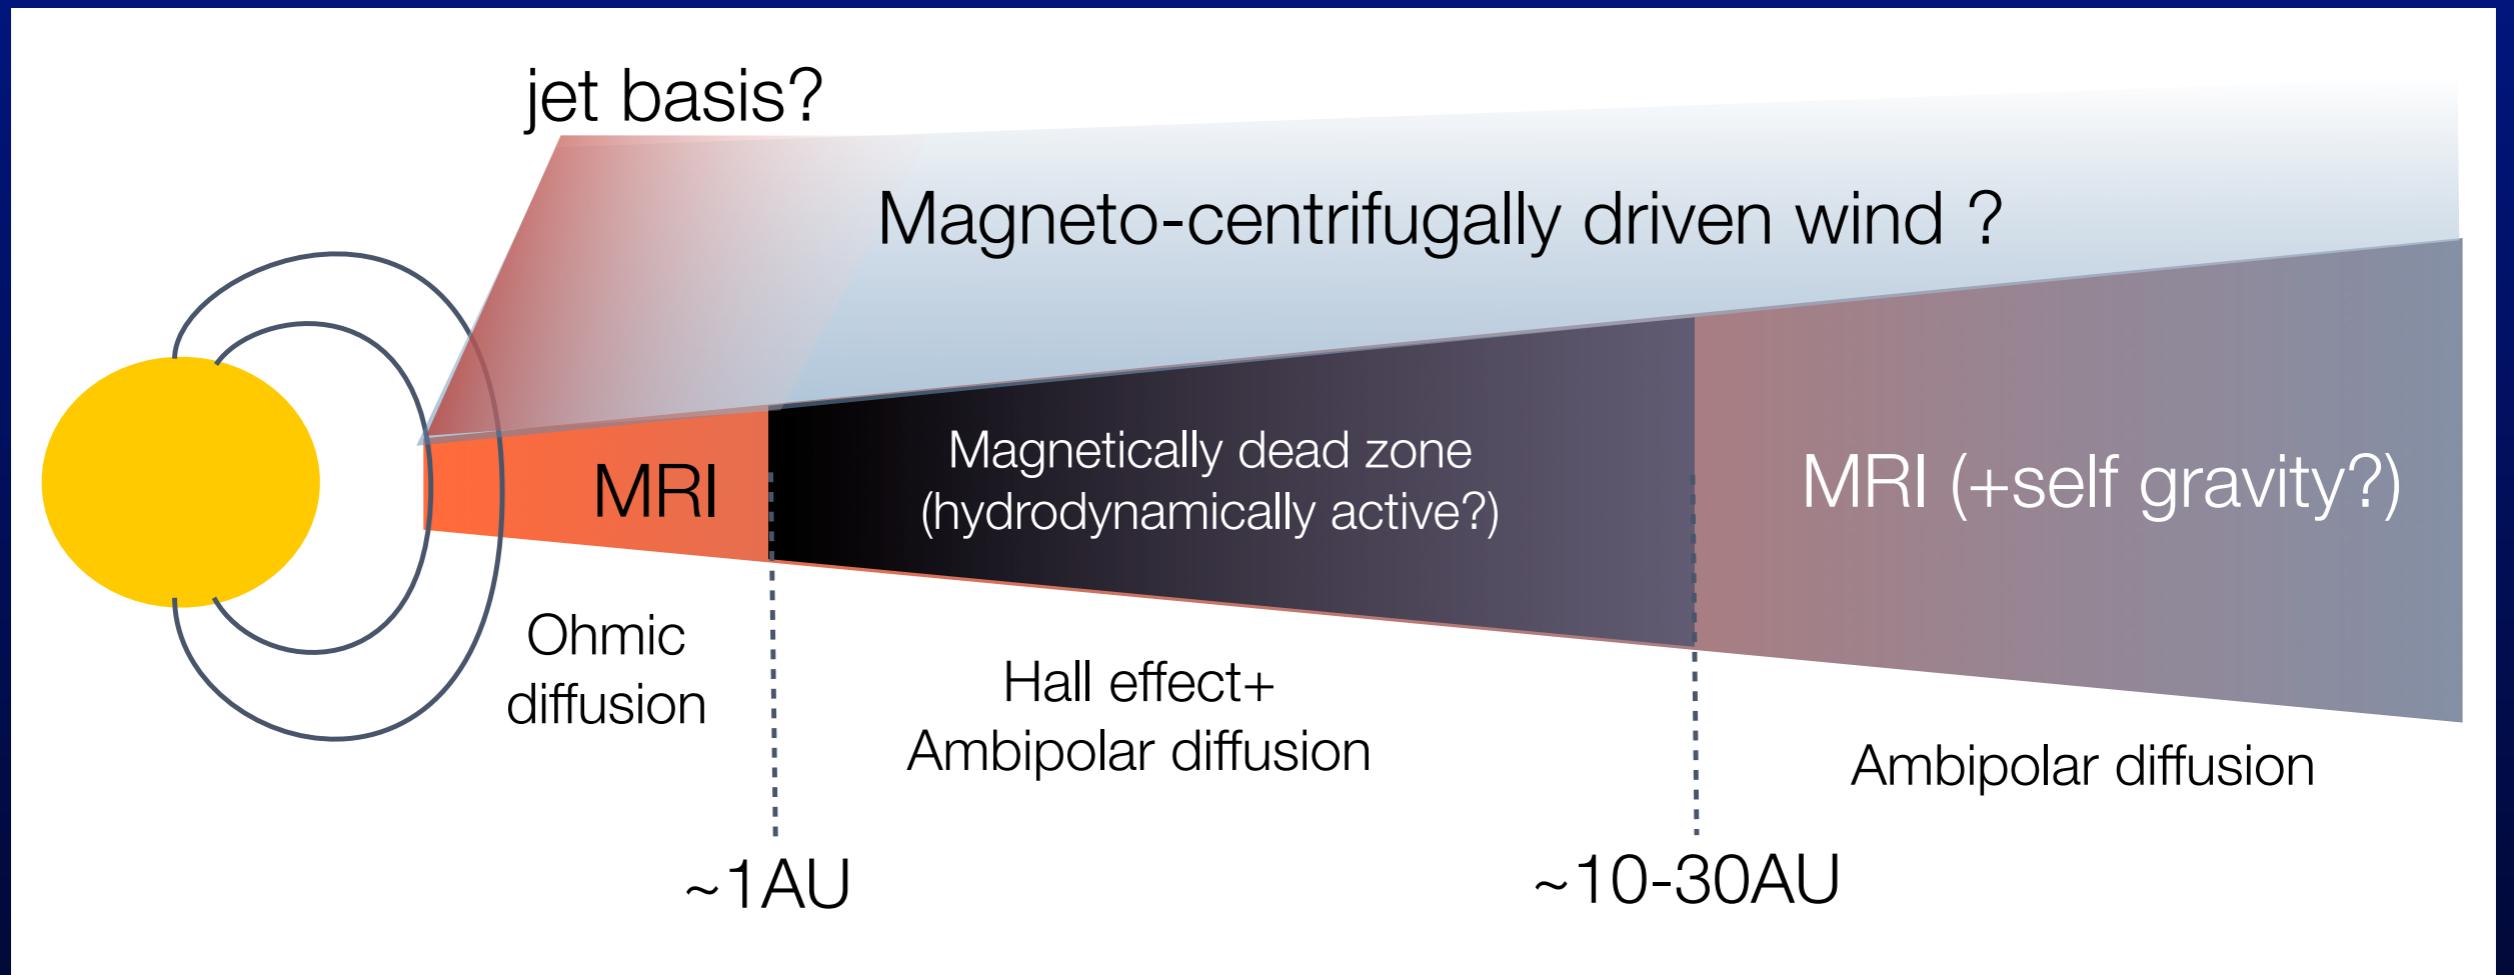

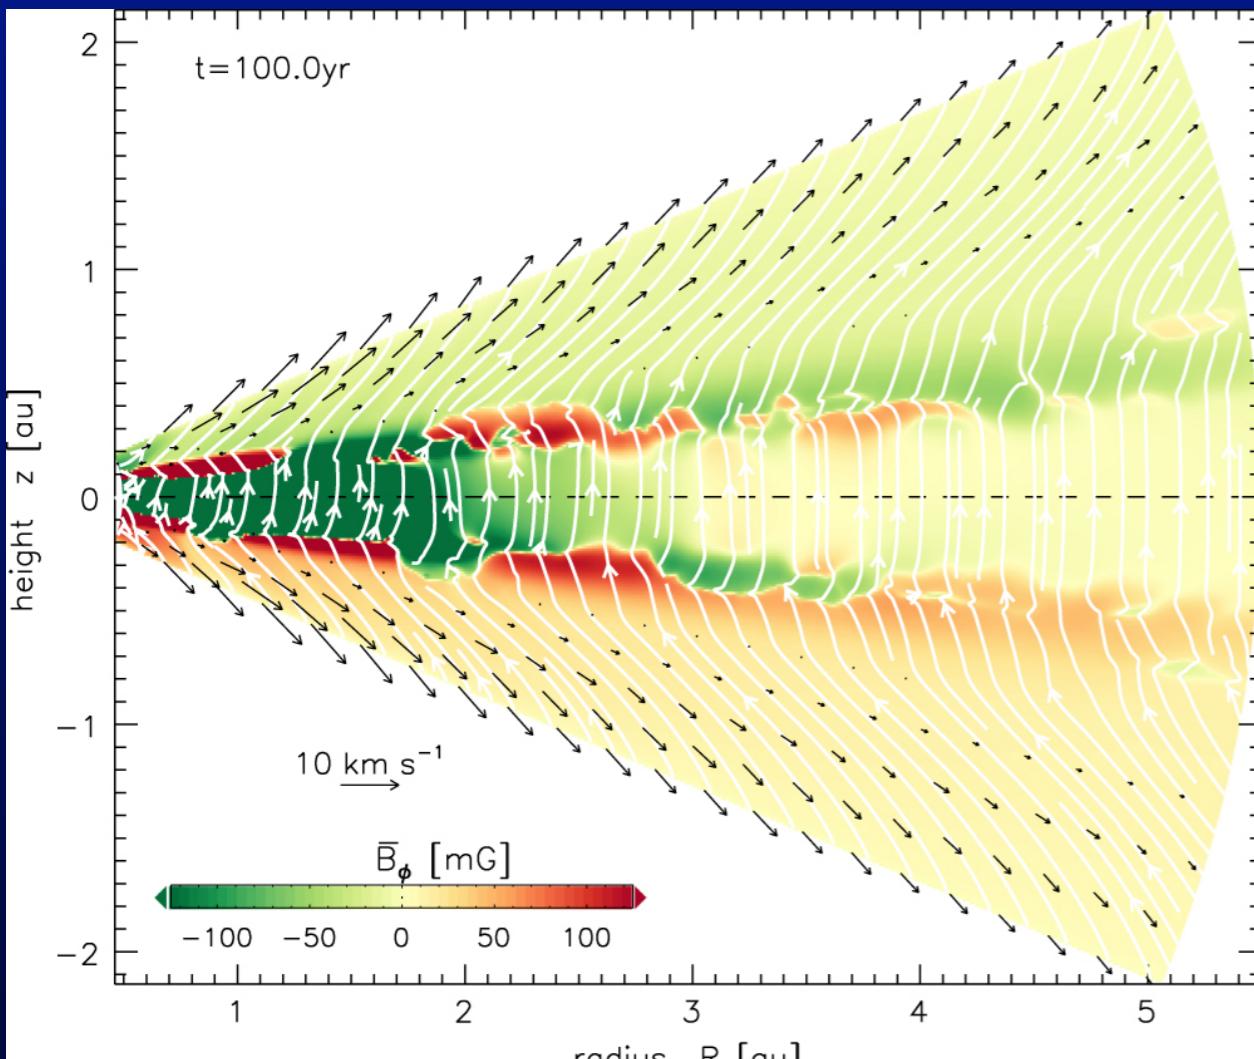

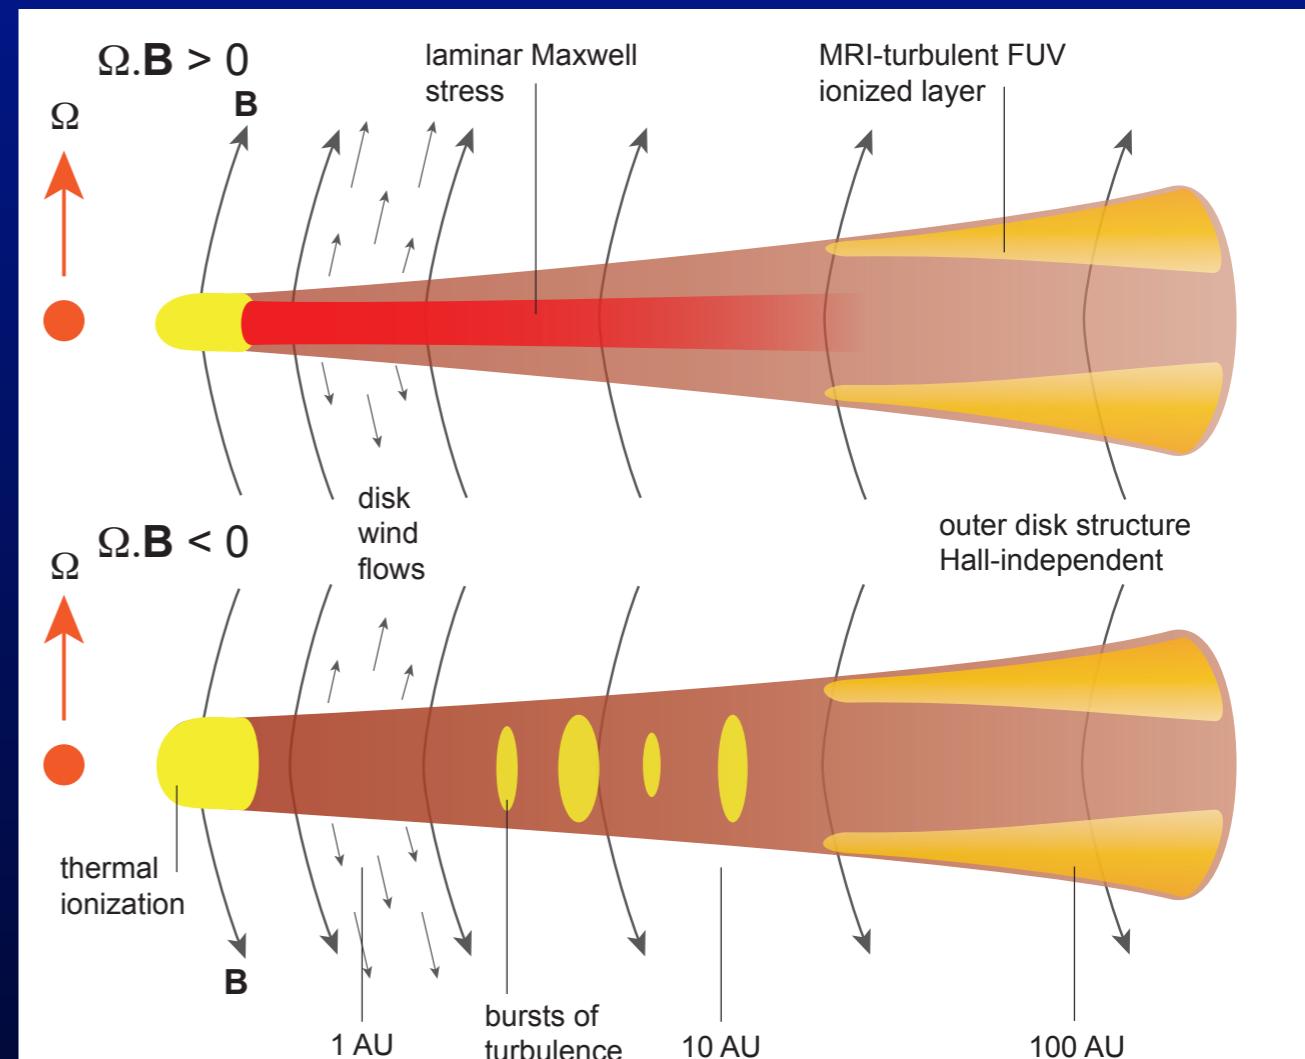

Figure courtesy of Geoffroy Lesur

In non-ideal MHD simulations, ambipolar diffusion + a vertical (poloidal) B-field invariably results in a magnetically-launched disc wind.

Gressel+ (2015)

Simon+ (2015)

Many uncertainties remain, most notably the lack of global simulations.
Likely that mass-loss is a combination of MRI-wind + photoevaporation: “magneto-thermal wind” (Bai+ 2016)
